1. Re: AUTOMATIC DIGITAL ON HF

Newsgroup: rec.ham-radio
Date: 1990-01-01 00:14:01 UTC
From: johnh@hpubvwa.NSR.HP.COM
Message-ID: <2880003@hpubvwa.NSR.HP.COM>
Source record: 14509

I have recieved a couple of interesting responses to my original posting. My main concern is that we don't regulate ourselves into a corner... Open up more of the band for the Automatic modes, but use Gentlemen's Agreements (i.e. SSTV is allowed on much more spectrum than where it is actually used) ...

One of the places I would really like to see a lot of Automatic Operation is 28.000 to 28.1xx ... not to many of the Frequency Pirates from 27Mhz. would hang around with "Brapp Brapp Brapp"

John

From: rusty@cadnetix.COM
Message-ID: <10723@cadnetix.COM>
Source record: 14515

In article <10695@cadnetix.COM> I write:
>I'll probably be gone next 2 weeks from the un-net, but that does
>not mean you cannot go and talk to each other anyway! so don't let
>my absence keep you from un-netting away!

So, anybody have any luck the last two weekends?

>Also, when I get back (first weekend in Jan, probably),

Well, I'm back. :-)

>lets move the
>time later an hour (1700-1900Z),as I got 2 positive replies, and no
>negative replies to my query.

In case you forgot, the question was whether or not moving the time
to 1700 - 1900 Z would improve your ability to join the 'un-net'.

>Thanks, 73, happy holidays, and cu after Jan 1!

Er, lets make that 'on Jan 1' :-)

<blatherings about the callsign database deleted>

>from rusty n7ikq (alias mr un-net, alias mr callsign project :-))

Ditto, I'm sure.

Summary: time of the un-net has been CHANGED to 1700 UTC through 1900 UTC,
the day stays the same ('every' Saturday). Thanks!

6. Radio as peripheral card in PC, Mac, etc

Newsgroup: rec.ham-radio
Date: 1990-01-01 19:36:55 UTC
From: root@sbcs.sunysb.edu
Message-ID: <4349@sbcs.sunysb.edu>
Source record: 14508
Cross-posted to: rec.ham-radio,sci.electronics

Has anyone investigated building a receiver as a plug in peripheral to
eg an IBM PC or Mac, etc? I'm curious as to whether the major problem
would be noise radiated into the frontend, or if power supply carried
noise would be the problem.

Rick Spanbauer, WB2CFV

8. AM antenna

Newsgroup: rec.ham-radio
Date: 1990-01-01 21:39:10 UTC
From: markj@lopez.UUCP
Message-ID: <1083@lopez.UUCP>
Source record: 14514
Cross-posted to: rec.ham-radio,misc.misc

I stumbled across a catalog that had an AM antenna that is supposed to increase your signal by 75X. Living out in a rural area with virtually nothing on the AM band during the day, I shelled out the $50 and gave it a shot. When I received it, I found there are no connections like you find on active antennas, and no power required. You just place it near your radio <must have a loop-stick Am antenna> and tune the dial on the antenna. On empty parts of the band, stations would just jump out of no-where. I haven't had any "record" Dx but it does improve the reception on stations I already receive. The CHEAPER the radio, the better the improvement. I have a cheap clock radio which up until now, received 3 stations. Now, with the antenna, it has turned into a DX MACHINE. I strongly recommend it for people like me who live out in the boonies and want better reception.

9. CW subbands

Newsgroup: rec.ham-radio
Date: 1990-01-02 01:18:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500344@ux1.cso.uiuc.edu>
Source record: 14511

I am curious about the history of the HF subbands. I would like to know why it is that CW and RTTY have been lumped together? Two reasons I have thought of are:

1. CW and RTTY are both digital modes, so should be together.

2. Phone emissions became so popular they threatened to overrun all other emission modes.

Which of these reasons was more important? Were there any others?

My personal opinion is that HF bands need some slice of CW only where not even RTTY or packet is allowed. Fundamentally better is no regulation at all, but far too many hams have shown on these bands that the regulations are absolutely needed. So if we have to have them, can we improve them?

50.0-50.1 and 144.0-144.1 are CW only subbands. Why can't we have some (albeit smaller) on the "crowded bands"? How about the first 50 khz of 80, 40, 20 and 15, and 28.0-28.1 ? (CW would still always be legal anywhere)

How will this affect packet?
How will this affect conventional RTTY?
Will CW contests stay in the CW-only bands?

[if you must flame, do it in e-mail where I can delete it faster]

10. Motorola HT-600 Mods.

Newsgroup: rec.ham-radio
Date: 1990-01-02 03:40:13 UTC
From: lawrence@smcnet.UUCP
Message-ID: <475@smcnet.UUCP>
Source record: 14518

I posted this question a while back and got no reply. We were having problems with our modem so here it goes again....

Does anyone have the information on how to convert the Motorola HT-600 or P-200 Radius radios from 2 channels to 6 channels. If you remove the stopper on the freq. select switch you can physically move the switch into channels 3-6 but the thing still only acknowleges channels 1-2. The radio will also let you program freq. data into CMOS RAM for channels 3-6 so I feel real close to finding the answer tho this puzzle.

The question here is:

- Is there an additional jumper or diode somewhere?

- Does the radio have "2 CHANNEL ONLY" burned into a chip somewhere?

I heard rumors that somewone in L.A. had figured out the mod. Has anyone else?

Thanks in advance and Happy New Year.

11. Lagalities of Phone Patches

Newsgroup: rec.ham-radio
Date: 1990-01-02 03:45:10 UTC
From: julian@bongo.UUCP
Message-ID: <287@bongo.UUCP>
Source record: 14512

I have been somewhat troubled of late. last week I was
driving along the freeway and decided on a whim to ask a girl
out to dinner. It was mid afternoon, so I called her at work
using the Autopatch facility of the local 220 MHz repeater. The
attendant (operator) at the girl's employer put me through to
her extension but she didn't answer. I was routed back to the
attendant who put me on hold while she paged.

The phone system had a "music on hold" system. While waiting
to talk to my party I had to endure a commercial from Domino's
Pizza and a rendition of "When Will I Be Loved." Yes I did get
to make the dinner date and all went well. What troubles me is
this:

Was I "Broadcasting"? Will the FCC get in touch with me?

Should I pay royalties to BMI for the broadcast of the song?

Can I collect a fee from Domino's for running the Ad?

Myself and several barrackroom lawyers await the answers.

Your "learned friend"

12. Desperately seeking info/plans for a VHF FM audio receiver (Please, somebody help me. Anybody!)

Newsgroup: rec.ham-radio
Date: 1990-01-02 04:17:11 UTC
From: tedi@Apple.COM
Message-ID: <37541@apple.Apple.COM>
Source record: 14513
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.electronics

I'm posting this for a friend (Chris). Please respond to him through me (Ted) at TEDI@APPLE.COM.

I am a hobbiest desperately seeking information on how to obtain or build a tiny portable VHF FM audio receiver. In my "research" on the subject, I have obtained hundreds of schematics for receivers of every kind. However, I was surprised to find that the info of was of any help for my little "pet" project. I realize that this is a RIDICULOUSLY simple device but I seem to be getting nowhere fast.
Here are my specs:
* Freq Range: 150Mhz-216Mhz
* Signal: FM audio (mono) 80Khz-20Khz (or as good as possible)
* FM Modulation: +/- 15Khz
* Dimensions: Smaller than a deck of cards
* Power requirements: Able to run 2-4 hours on small batteries

I will need to tune to any one of 5 or so frequencies which I already know. Therefore, the device should be crystal controlled. This project is basically a simple VHF FM receiver and I could easily build it myself, if I only had some schematics to work with. I can handle the power supply, amplifiers, antenna and housing.

I would be very grateful if anybody could provide me with information/plans or point me in the right direction. I might even be willing to make an extra one for you, depending on how things work out. Please respond by MAIL to TEDI@APPLE.COM or by calling me (Chris) collect at 408 522-8373. Happy Holidays!

13. Celebrity Hams

Newsgroup: rec.ham-radio
Date: 1990-01-02 11:29:00 UTC
From: lwrclmr@SACEMNET.AF.MIL
Message-ID: <9001030803.AA23956@ucbvax.Berkeley.EDU>
Source record: 14430

I have seen previous interest in celebrity hams recently in this newsgroup.
Here's another one for those who are interested.
Ronnie Milsap WB4KCG, Nashville, TN, Advanced Class.

Although I haven't talked to Ronnie, I have heard he's fairly active. He also
did a PSA for ARRL a few years ago and it occasionaly shows up on TV somewhere.
I think I saw it on a PBS station.

Just in case there is someone who doesn't know Ronnie, he is a popular Country &
Western singer. He is also blind. He writes most of his own music and plays a
variety of instruments.

"All" Band Verticals....

REMEMBER, that unless you put LOTS (>50) of radials on the ground,
or you mount the vertical 1/2 wave above the ground (for the lowest
band) (BEST WAY)- the system will be inefficient due to ground losses.
This is because you are trying to use the ground as the other half
of your antenna, and unless you live on the sea shore, ground losses
will be appreciable.

I have owned the Hustler 6BTV and Cushcraft AP-8 and have heard about
the Butternut HFV6 (or whatever it is called).

Hustler 5BTV: Very sturdy, well constructed - went up and tuned up
fairly easily and without any hassles. I have used this antenna
without radials, and have made contacts. So far as I know it does NOT
have the capability of mod. for 12 and 17 meters. 30M can be added.

Cushcraft AP-8: Only vertical that comes ready to work ALL the bands
including WARC. I had trouble with initial tuneup, and there was a
bad connection on one of the trap coils which arced. After fixing, it
seems to work well, except that the 10M section could never get
close enough to resonance, and the antenna is not real sturdy, although
it could be guyed to help it out. It also has a funny mounting, as it
is slipped over a mast rather than clamped to it like the Hustler.

Butternut: I have heard favorable things about it, and with add-ons
can be used on all the bands. It does look kind of flimsy to me though.

Yes, Collins has been doing it for years in their HF receivers.
Recently, Kenwood introduced the TS950 with DSP.

>
> At some point commercially available microprocessors should be
> fast enough for real-time DSP to simulate just about any filter
> bandpass we'd want. The question is are the currently available

Well, there was an article in "VHF Engineering" where the author
actually used an MC6800 (he lives in Yugoslavia, so that may be
all he could get). However, you really need to use a dedicated
DSP chip like the TI 32010 series. They have much more effective
power than even a 486, when used for DSP. Even so, it is quite
possible to run out of horsepower even with TI's latest 32XXX
parts. Motorola has come out with the much faster 56000 family
which will probably be able to do just about an receiver
filtering function you would want. You'll still need a
relatively low final IF of 10 to 100 kHz, even with a 56000.

I think the problem with using a Digital Signal Processor (with the required ADC and DAC) as the main IF filter in a receiver is dynamic range. Even a 16-bit signal has less than 100 dB. If you set the high end to be 0 dBm (better would be +10 or +20), then your digitization noise would be around -100 dBm. Receiver sensitivity (for 10 dB S/N) could be no better than 7 uV.

Digital filtering would be useful if done AFTER the AGC'd stages so you wouldn't need so much dynamic range.

Well, I guess it's UseNet Ad Hoc Committee time again, a la the no-code proposal. Volunteers, take one step forward.

Yup, I think it's time. While we're at it, let's dump ASCII and go for real bit streams. There are more efficient modes than asyncronous ASCII.

As far as 97.309(a) goes, I'll have to find a copy of Part 97. I assume it talks about 7 bit ASCII with parity, but not 8-bit ASCII. What a shame. 7-bit ASCII was obsolete a couple decades ago. Nothing like trying to make a silk purse when all you have are sow ears.

A question I have is regarding the HF packet restrictions on 300 baud and nothing other than ASCII. From what I read in Phil's posting (thanks), it wasn't clear if we couldn't use LZ compression on HF, as long as the parity bit wasn't used. The LZ program is easily modified to do this. At 300 baud, you need every optimization you can find. It also isn't clear why 300 baud is maximum, given that 9600 can be done over telephone (3KHz) channels now. Again, I suspect we are dealing with technology artifacts in the rules.

Give W1AW some slack ? This really sounds like some stations are more equal than others. Yes, there is a gentleman's agreement here. The problem with these agreements is that newcomers (like me) don't know all the rules and get stepped on (and do our share of stepping, too). I thought all I needed was my ticket. Apparently, I need to buy some of the ARRL literature, too. Funny, I didn't think that was in Part 97.

I think it all boils down to the same ugliness we saw on '313, other nets, and the non-stop Bible-on-CW transmitters. I'm not part of ARRL, and don't take kindly to automatic QRM. In this case, I QRT'ed shortly after hearing them, feeling sheepish about possibly QRMing someone that actually listens to that stuff in the middle of the night. Afterwards, I was angry for feeling sheepish. Then I got angry about auto-QRM.

Makes me want to get a legal-limit amp, and pipe the online KJV through my morse code generator onto 7.290 at legal limit. Nah. I'm more civilized than that. Is W1AW ?

I mean, why do it to all HF bands ? Maybe two would suffice. We don't hear W1AW on 40 out here, unless we listen hard beyond the snap, crackle, and pop (and go deaf).

23. 31 metre helical wound dipole (10 feet long!)

Newsgroup: rec.ham-radio
Date: 1990-01-02 23:35:51 UTC
From: ems@Apple.COM
Message-ID: <5971@internal.Apple.COM>
Source record: 14524
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Well another holiday came and went, giving me the chance to try
yet another antenna design. This one was a 31 meter helical wound
dipole.

Summary: It works with 4 foot elements on a 2 inch boom, and rather well.

I used 2 inch diameter PVC pipe for the form and wound two elements
on it. Each element is 4 feet long and made of 22 ga. enamel wire
wound about 1/2 inch pitch. I then pruned it to resonance (about
82 turns per helix were left after pruning, but I havn't recounted to
see exactly what I was left with ... if you really care, let me know
and I'll go count turns again.) The wire is held in place with
strapping tape every 8 inches or so (varnish to follow someday...).

The wire is connected to a metal post at each end. These are made
from 3 inch brass bolts passing all the way through the mast with
two nuts and washers (for leadin attachment and/or loading coil
attachment; a future project...)

There is a 2 inch gap between one helix and the other (where the
coax is attached) and both elements are wound with the same screw sense
(i.e. the handedness is the same. Just picture it as one long helix
with a 2 inch section chopped out for the leadin.)

Construction was a snap. I used an electric drill to make holes for the
bolts. The bolts were inserted (two in the middle, each one inch toward
a mast end from the center; and two more, each 11 inches from a mast end.
The mast is a 10 foot lenght of 2 inch diameter schedule 40 PVC pipe.
Nuts and washers were screwed on loosely. The enamal wire had the
insulation scraped from an end, the end was attached to a bolt and the
nut was tightened, then 88 turns were loosely wound onto the pipe to
make that helix.

The turns were spread evenly over the 4 feet and taped in place, the other
wire end was stripped and attached to it's bolt. Repeat for the other
helix. Then an antenna bridge was used to prune for resonance at 31
metres. It looks like about 82 turns were left in each helix.

I have installed the antenna as a 'sloper' on my roof and use coax for
the lead-in. (I added a 'T' to one end of the pipe and put a hinged
TV mast foot on the other. The hinged foot is screwed to the eaves of the
roof and the other end leans against my brick fireplace chiminey. A
wire rope passed through the 'T' fitting is tied arround the chiminey.
The antenna angle is about 45 degrees with the slope pointing east.
(low in the east, high end in the west).

You cannot see this antenna from the street, as it is behind the
chiminey and roof. From the back yard it looks like a chiminey
support of some kind. Some paint to match the roof color would make
is mighty hard to notice!

Total time to construct and install (not counting going to the store
to get the pipe...) was about 3 hours. Total cost was about $6.00
including the brass bolts. (Though it only includes a 'pro-rata' share
of the $14 of enamel wire I bought ... ALOT is still on the spool...)

Performance? It seems to work well for me, given a subjective evaluation.
I don't have a good reference antenna. (Why would I be playing
with helicals if I had room for a full sized dipole! I may yet put
up a folded dipole for 31 metres as a reference antenna ...)
What I can say is that for the first time ever I have used the
attenuation switch on my Sony 2002 radio. I recieved both WWV and
WWHV clearly on 10000 hz with the attenuation on. It seemed like
every 5khz increment had SOMETHING on it (which has not been the
case with other antennas...) and I had to use the fine tuning
to pick out which one I wanted far more than with other antennas.
It beat the pants off all my indoor antennas and the 'long wire'
that is really about 40 feet strung on the roof top.

So far I like it very much. It could be that propagation was just
suprisingly good the first night ... but I doubt it. The reception
on the whip antenna was about as usual. (Though I did get a bit
of a surprise there... I was using a 3 foot piece of twin lead
from the coax to the radio jack. I unplugged it from the radio to
see how the whip was doing. Not much change. Hmmm I wonder; what's
wrong. I pick up the radio and walk to the kitchen to get some Coco
and think. Reception plummits. Removing the twin lead chunk
provides the answer. Whip was picking up signals from the twin lead...
gotta get reciever with a real coax connector on it ...)

I intend to wind one of these for 49 metres and one for 25 metres.
If I get real ambitious I'm going to wind a helix as a director
and try to make a beam out of it. At 0.2 wavelength that's only
6.2 metres or about 20 feet separation between the elements for
a 31 meter beam. I have 20 feet of rooftop ...

Another modification: I am going to make one with a 'T' in
the center. Then the individual elements can be friction fit
into the 'T' which can be friction fit onto a short mast (like
5 feet). This will give me a 'take down dipole' for use when
traveling ... 4"x4"x5' for a dipole in a bag? Not bad!

Conclusions? I think it works well, but would like to find someone
with a 'real dipole' to compare it to. It is certainly easy to
construct and install. As a sloper on the rooftop it is astoundingly
easy to find a place for it and point it. I'm not sure how directional
it is (if at all) since I have no signal strength measuring gear.
It is not particularly sensitive to design parameters (the 2" coil
resonated within 10% of the same wire length as a 4" version

using plastic insulated hookup wire) though it is most sensitive
to coil spacing (pitch) at the feed point. ('loading coils' are more
effective the closer to the feed point they are.) I don't know if the fact
that I'm using pudgy coil forms (2 inches to 4 inches) is causing
higher than expected impedences or if I'm just not very good at
using my antenna bridge. It measured about 40 ohms. I was expecting
much less. If you don't have room for a full sized dipole, one of
these would be a quick and easy alternative.

From: rlwest@flopn2.csc.ti.com
Message-ID: <9001030051.AA21296@ti.com>
Source record: 14432

I've seen mods posted for several radios here, but none in the time I have
been watching the net have mentioned the Alinco ALD-24T. (or any Alinco, for
that matter!)

I received from Alinco a mod to change the up/down switch from VFO to MEMORY
mode, but promptly filed it away. I did not do the mod, but now intend to
as soon as I find the paper they sent me.

I complained in the letter I sent with the warranty card about that feature,
and so I guess they had lots of complaints, because this was a photocopy
of something that looked like it'd been sent out a lot.

I was wondering if there are any other common mods that might have appeared
in the past? I'd kinda like to be able to hear NOAA, or any of those neat,
nasty things you can do.

This is an older radio, I guess, having been a close-out in '88 when I bought
it. They now have a newer spiffier model, with a higher price tag...

Anybody got comments, complaints, or anything about this critter?

73, Bob West WA8YCD

I wouldn't say the value is unquestioned. The only time I've ever heard them is when I run across them by accident. They may be invaluable to the people who do listen, but I would bet fewer listen than the ARRL would like to think.

> that W1AW has been using pretty much the same frequencies for decades, one
> might ask if some people are 'volunteering' to be QRM'ed.

I agree. The frequencies are very well known in the ham world. Trying to operate there makes about as much sense as standing on a train track and complaining about the train traffic.

27. A question about receiver components

Newsgroup: rec.ham-radio
Date: 1990-01-03 02:14:35 UTC
From: dbraun@cadev5.intel.com
Message-ID: <1429@mipos3.intel.com>
Source record: 14427
Cross-posted to: rec.radio.shortwave,rec.ham-radio

(This is a repost of an article that never got out, I think)

I have a shortwave radio that a recently rescued from my parent's place.
It is a Heathkit GR-78 general coverage receiver that I built about
12 years ago. It's not a bad radio, but I was thinking of doing something
to improve it.

The IF section is at 455 KHz, and it uses four of these little creamic
filters for the filtering. I would like to modify the circuit to have
something fancier, such as a crystal IF filter. Does anyone have information
on where I can get these sort of parts?

Three possibilities have presented themselves:

1: Collins mechanical filters. Where can I get these? Hamfests?
Someone told me they would be quite expensive ($150).

2: Could I build some sort of network out of these ceramic filters?
I can get lots of them cheap. I guess these electrically look
something like a quartz crystal, but with a lower Q.
I saw a vague reference in the ARRL handbook that you can make
"a crystal filter in a ladder configuration, where all crystals
are cut to the same frequency". Could I do the same thing with
ceramic filters? Where do I find more information on this sort
of thing?

3: Apparently companies such as Murata make mulit-element ceramic
IF filters that are presumably used in most modern receivers.
Has anyone ever seen them for sale or bought any?

If anyone has some advice or references that would help me,
please let me know.

28. AUTOMATIC DIGITAL ON HF

Newsgroup: rec.ham-radio
Date: 1990-01-03 03:56:04 UTC
From: jpb@ATHENA.MIT.EDU
Message-ID: <9001030356.AA26316@M11-113-7.MIT.EDU>
Source record: 14433

In reply to the 28 Dec 89 message of John D. Hays, KD7UW:

I have no opinion one way or the other on whether or not Automatic
Digital subbands are a good idea, but I fail to see why the CW bands
are the best place from which to take them. The phone bands are far wider;
removing any given amount bandwidth from them would clearly have less
of an impact than removing the same amount from the CW bands.

Knocking the CW bands down to 25 kHz from the current 60 kHz or so
would leave the remaining part extremely conjested. Trimming 35 kHz
from a 200 or 300 kHz phone band would be noticed, but not a disaster.

Whose idea was it to take the space from CW ?
Maybe the "Phone Good Ol' Boys" ?

FEDS FINGER SHORTWAVE JAMMERS AGAIN

Copyright 1989 by Bob Parnass, AJ9S

Shortwave broadcasters in the United States, the United Kingdom, Israel, and West Germany have long been subjected to intentional interference (jamming).

To identify the jammers, an intensive investigation was conducted in 1984 and 1985 under the auspices of the International Frequency Registration Board of the International Telecommunication Union (ITU). A 318 page report was issued after the investigation,1 and I summarized the report in an earlier article2.

Since the original study, closer East/West relations have led to a decrease in jamming. The Russians have stopped jamming Radio Liberty's broadcasts aimed at the Soviet Union, ending a 35 year long tradition. Another study was conducted in July 1988, and this article summarizes that report.3

Jamming Characteristics

Foreign language programs, particularly those in languages spoken in Iron Curtain countries, are the primary targets of the jammers.

Jamming installations fall into two categories:

1. Ground wave jammers are used for localized jamming, directed toward the immediate vicinity (up to 100 km) of the jammer. They are situated close to the people who are to be prevented from hearing the broadcast, and are effective in blanketing high population regions with strong signals.

2. Sky wave jammers are used to prevent people far away from the jammer from hearing the targeted broadcast.

The jamming transmitters monitored in this operation were assumed to run 250 KW power and antennas with 10 dB gain. Jammers need not provide a signal with the same field strength as the broadcast signal in order to be disruptive to the the targeted transmission. By using appropriate

modulation schemes, a jamming signal can obtain 10 to 15 dB relative gain compared to a broadcast signal.

Sometimes, several different jamming transmitters are used at the same time to interfere with a single broadcast frequency. About 90% of the jamming signals observed during the study were accompanied by a 2 character Morse Code identifier, which presumably allows the offender's field monitoring stations to determine the effectiveness of each jamming transmission.

Monitoring Stations

Jammers were monitored between July 4 and 24, 1988, in a cooperative effort by monitoring stations in West Germany, the United Kingdom, Norway, Sweden, Canada, South Korea, Japan, Italy, and the United States,

The American locations were FCC field monitoring sites, and most employed fixed monopole (Wullenweber) antenna systems with goniometers.

Most European monitoring stations employed Adcock antennas, and Korean and Japanese stations used log periodic antennas.

Findings

The July 1988 study uncovered an entirely new set of markers (Morse Code identifiers), different from those recorded in earlier studies. Monitors reverified their assumption that each marker transmitted from only one location.

Although the markers heard in 1988 were different than those in 1984, the general locations of the jammers did not change drastically. The 1984 surveillance traced the source of most jamming to the USSR. In 1988, 61 of the 69 jammers monitored were again located in the western USSR, with a large grouping around Moscow. Four jammers were located in Czechoslovakia and three in Bulgaria.

Most jammers in the USSR were aimed against Russian and Russian dialect broadcasts, with the exception of a few Bulgarian and Czechoslovakian language jammers.

Russian jamming of Polish language broadcasts stopped, even though they were consistently jammed in 1984. Jamming of Radio Liberty stopped, although it was jammed more than any other broadcaster observed in the 1984 operation.

30. Beam heading and range program

Newsgroup: rec.ham-radio
Date: 1990-01-03 07:16:39 UTC
From: sampson@attctc.Dallas.TX.US
Message-ID: <10814@attctc.Dallas.TX.US>
Source record: 14434
Body handling: HTML body converted to readable text

I donated this program before, but it didn't work at +/- 90 degrees latitude. This was due to an acos() Domain Error. I took the easy way out and just changed 90.0 to 89.9 when entered. This archive is basically for those who need a quick command line bearing and range to a station. If you forget the syntax a little usage message is included. The Basic version is not as good but should work on the older micros. The gc.exe is based on the C version and for IBM PC. I used a PC to shar this so your extract may not like the character count. I'd be interested in a command line version that uses Grid squares. Steve, N5OWK, EM15gh

```
#! /bin/sh
# This is a shell archive. Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file". To overwrite existing
# files, type "sh file -c". You can also feed this as standard input via
# unshar, or by typing "sh gc.c <<'END_OF_gc.c'

31. 80-10 meter short verticals.

Newsgroup: rec.ham-radio
Date: 1990-01-03 09:38:30 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <03.Jan.90.09
Source record: 14428

Remember that on 80 and 40, short loaded verticals will show very low
radiation efficiency, since the actual radiating element is a small fraction
of the wavelength. They will also show narrow bandwidth - or at least they
SHOULD if the 'Q' of the antenna is high. This can be inconvenient, as
modern solid-state PA stages reduce power when running into high SWR.
My experience of a base-loaded 25 foot vertical on frequencies around
4.3MHz was that it had a usable bandwidth of about 80KHz.
Outside this bandwidth, you could either go outside to retune the
antenna (climb a ladder and move alligator clips on an air-spaced coil)
or resign yourself to transmitting into a dummy load. (Eventually our patience
ran out so we put up a full-sized dipole, as we had the space)..
You will need a good set of ground radials tuned for each band. Some people
cut the radials to length, then bury them in the ground, but they do not
realise that the length needed for resonance is altered (because wet earth
of variable dielectric properties does not approximate to the 'free space'
velocity of the same length of cable in air).
Their radials are then non-resonant and of reduced efficiency.
If you must bury radials, cut them to length using a dip oscillator
AFTER you have buried them. You will get VERY muddy doing this, but
at least you will have a good RF ground.
Commercial organisations (the BBC) have been experimenting with ground
radials mounted a few feet above the earth, and this has shown greater
efficiency. I can't remember the exact date, but it was published in
RadCom about a year back.

MICROSAT LAUNCH STATUS REPORT #1

HR AMSAT NEWS SERVICE BULLETIN 345.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 11,1989
TO ALL RADIO AMATEURS BT

MICROSAT LAUNCH STATUS REPORT

Since arriving in Kourou, French Guiana on Saturday, Dec. 2nd, the AMSAT
MICROSAT team has been busily testing each of the MICROSATs and preparing
them for launch, this process has included the final calibration of
the various telemetry channels on all four MICROSATs. Specific telemetry
information will be published in an up-coming edition of the AMSAT Journal.

Other activities in which the AMSAT MICROSAT team have been involved in this
past week included a test-firing of a pyrotechnic bolt cutter to ensure that
the sequence of events for the release of the MICROSATs from launch vehicle
will occur properly. Also, all of the flight computers have been turned on
and the flight software has been loaded. Likewise, each of the transmitters
for the different MICROSATs have been thoroughly tested and checked for proper
operation. W3GEY reports that all is going well and the AMSAT team members
are in good spirits and enthusiasm is running high.

The four MICROSATs and two UOSATs are flying as secondary payloads
to the French SPOT-2 satellite aboard an Ariane IV launch vehicle.
This mission is designated as mission V-35. The launch window for
this mission will open at 01:35 UTC on January 11th, 1990. The
window is 10 minutes in duration. If the launch does not occur
within this 10 minute window on the 11th, the next window of opportunity
will occur on January 13th UTC at about the same time.

In order that radio amateurs around the world can listen to the launch
activities in real time, AMSAT officials are planning an extensive AMSAT
Launch Information Network Service (ALINS). Specific details concerning
the ALINS will be announced via the AMSAT News Service next week.

AMSAT-NA FIELD OPERATIONS UPDATE

HR AMSAT NEWS SERVICE BULLETIN 345.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 11, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA FIELD OPERATIONS UPDATE

AMSAT-NA Vice President of Field Operations, Jack Crabtree, AA0P, has announced the following recent change to the Field Operations Organization. To improve support for California AMSAT members, the Pacific Region has been split into two separate regions. Southern California and Hawaii now make up the Pacific Region. The Pacific Regional Coordinator is Gene Davies, AA6NP. Northern California and Nevada now make up the Sierra Region. Bob Gobrick, WA6ERB has been appointed the Regional Coordinator for the Sierra Region. AMSAT is confident this change will improve Field Operations support to these areas and welcomes Bob and Gene to the AMSAT Field Operations Management team.

AMSAT OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 345.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 11, 1989
TO ALL RADIO AMATEURS BT

Following is the schedule for Operations Nets for the next several weeks.

Day UTC Day U.S. Freq. NCS Guest

16 Dec 89 1855 Saturday 435.970 N5BF KO5I ** Note Time Change **
30 Dec 89 1415 Saturday 435.970 N5BF KL7GRF
07 Jan 89 1700 Sunday 435.970 TBD TBD
20 Jan 90 1400 Saturday 435.970 N5BF TBD

The start of the 16 December net, originally given as 1830 UTC will be delayed to accommodate the mode J/L ZRO test scheduled for that time. Those wishing to participate in both the Operations Net and the ZRO Test will therefore be able to do so. The net will probably begin around 1855 or 1900 UTC. Doug Loughmiller, KO5I, AMSAT-NA President and General Manager will be the featured guest.

On 30 December, John Fail, KL7GRF, will be discussing satellite DXing, presenting operating hints and information about the upcoming DXpedition to Bouvet Island.

Mark your calendars now for both of these interesting and informative Operations Net sessions.

CC: dloughmiller
Subj: Sequence mixup on ANS-345

The following message has been posted on the W3IWI BBS:

SP SYSOP @ AMSAT < W3IWI $ANS-345.ERR
Sequence mixup in ANS-345 bulletins
R:891213/0604z 23532@W3IWI [Balto/Wash MD/DC/VA/DE] Z:21029

Apparently a sequence mixup occurred when this week's AMSAT bulletins
were posted and the bulletin name in the text may not match the BID on
four of the bulletins. The BID is correct! Do not change it!

BID $ANS-345.02 matches "AMSAT-NA FIELD OPERATIONS UPDATE" which has the
text header "AMSAT NEWS SERVICE BULLETIN 345.01 FROM AMSAT HQ"

Similarly
BID = $ANS-345.03 = AMSAT OPERATIONS NET SCHEDULE is called BULLETIN 345.02
BID = $ANS-345.04 = SATELLITE OPERATING SCHEDULE is called BULLETIN 345.03
BID = $ANS-345.05 = ZRO TEST SCHEDULE is called BULLETIN 345.07

After I spotted the problem I tried to correct the text in the copies sent
from W3IWI to match the BID, but a number of copies had already been exported.

73, Tom

MICROSAT LAUNCH STATUS REPORT #2

HR AMSAT NEWS SERVICE BULLETIN 353.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 19,1989
TO ALL RADIO AMATEURS BT

MICROSAT LAUNCH STATUS REPORT

Harold Price, NK6K reports that all of the MICROSAT spacecraft
were mounted to the Ariane ASAP on Wednesday, 13 December 89.
Finalized engineering checkout software was loaded the following
day and regular checks of telemetry since show all to be nominal.
Once the primary payload, SPOT 2, is mated to the payload
structure and fueled, the MICROSATs may only be trickle charged
10 hours per day. The mating is scheduled to occur on Tuesday 19
December followed by "encapsulation" or closing of the fairing
on Wednesday 20 December. The entire payload structure will then
be placed on the Ariane third stage around 3 January 90.

During the final days before the AMSAT - UOSAT closeout, team
members were busy with final preparations. Jeff Zerr and Chuck
Stout applied final thermal coatings to all spacecraft. Project
Manager Jan King, W3GEY, spent much of his time in meetings with
Ariane officials to verify the integration schedule and ensure
that the spacecraft batteries could be kept charged during the
final days before launch. He also was involved in carefully

rechecking everything to make sure that last minute handling had not damaged any of the spacecraft. WEBERSAT and UOSAT-E cameras were tested in an arrangement where each spacecraft could take pictures of the other and its support personnel. The LUSAT CW beacon was given a final tuning by Jose Machao, LU7JCN, and secured for flight.

With less than a month remaining before launch, most of the integration team have returned home or will shortly. Dave Cowdin, WD0HHU, has arrived in Kourou where he will spend the holidays and early January through launch day with the AMSAT payloads, monitoring their condition and making sure they remain in launch-ready condition.

MICROSAT / UOSAT LAUNCH NETWORK PLANS ANNOUNCED

AMSAT is planning a comprehensive AMSAT Launch Information Network (ALINS) in support of the up-coming MICROSAT/UOSAT launch. The launch net will provide real time coverage of the launch day activities.

Providing HF support for the ALINS activity will be W1AW, WA3NAN, W5RRR, W6VIO and several overseas stations. Additional stations may be added to the HF network. Exact HF frequencies and times of operation will be published in next week's report.

In support of local distribution via 2 meter FM repeaters around the country, AMSAT has, with the aid of the ARRL headquarters staff, secured the use of a teleconference bridge that will support over 100 different ports. It will therefore be possible for local repeaters to simply place a long distance telephone call and join the bridge.

It will be necessary for local repeater groups to reserve a port on the ALINS teleconference bridge. To reserve a port on the ALINS bridge for your local repeater group either drop a post card to: AMSAT Launch Information Network Service, c/o Courtney Duncan, N5BF, 4522 Ocean View, LaCanada, CA 91011. or make a telephone request by contacting Courtney at 818-957-8455 between 7 and 10 pm PST. Requests should be made no later than January 1st, 1990. AMSAT will notify repeater groups as to how they will be able to access the teleconference bridge around the 5th of January.

EARLY MICROSAT FLIGHT OPERATIONS DETAILED

HR AMSAT NEWS SERVICE BULLETIN 353.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 19, 1989
TO ALL RADIO AMATEURS BT

The engineering checkout software now residing in the MICROSAT computers is the software that will be used for the first few weeks of operation so that the spacecraft can be characterized in the space environment. Full telemetry will be available but there will be no interactive packet operation from the PACSATS, speech from DOVE, or pictures from WEBERSAT during the first few weeks of operation from space.

The four MICROSAT payloads are being flown "hot," that is, with electronics powered and software in the computer. When ejected from the ASAP, the separation switch will power satellite transmitter electronics, however, the transmitters will only be turned on by ground command later UOSATs D and E are, by contrast, being flown "cold," that is, the battery connection to the electronics passes through the separation switch. UOSAT ground command will spend the first several days of the mission uploading operating software to both spacecraft.

WEBERSAT, LUSAT, and PACSAT will be turned on between 90 and 300 minutes after launch. DOVE activation may be delayed for some additional time so that it can drift further away from the other MICROSATs to help prevent its two meter transmitter from blocking the receivers on the other MICROSATs.

Reception of WEBERSAT, LUSAT, and PACSAT will require an SSB receiver capable of tuning 437.0 to 435.2 MHz, an FO-12 compatible 1200 baud PSK demodulator, TNC, and terminal or computer. Early data may be obtained with the TNC in MONITOR mode but later, advanced operations will require TNC KISS mode operation and special PC software. DOVE telemetry will be transmitted in AFSK packet on 145.825 MHz FM. An unmodified 1200 baud terrestrial packet station can be used to receive this data.

Telemetry information and equations will be published very shortly before launch. Watch the AMSAT News Service for information on "opening day" for each spacecraft.

KL7GRF APPOINTED AMSAT OC - DX

HR AMSAT NEWS SERVICE BULLETIN 353.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 19, 1989
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Operations, Courtney Duncan, N5BF
announces the appointment of John Fail, KL7GRF, Operational
Coordinator for Satellite DX. John has been a very active
satellite DXer for several years, has been instrumental in
getting many countries active on the satellites, and has
generally taken the lead in coordinating satellite DX operations.

KL7GRF and "the group" can usually be found on AMSAT-OSCAR 13
on 145.890 MHz or 435.960 MHz when in Modes B or J/L
respectively. All satellite operators are welcome to check
in for the latest news. In addition, John writes an up-to-the
-minute DX column for AMSAT publications.
For more information write to John Fail, KL7GRF, 6170 Downey
Ave., Long Beach, California, 90805.

KL7GRF will be the featured guest on the AMSAT Operations Net
for 30 December 89 which will meet on AO-13 at 1415 UTC on
435.970 MHz. He will be discussing upcoming DXpeditions to
Bouvet Island and Juan Hernandez, scheduling, DX operating
hints, and other satellite DX issues.

MICROSAT LAUNCH STATUS REPORT #3

HR AMSAT NEWS SERVICE BULLETIN 360.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 26, 1989
TO ALL RADIO AMATEURS BT

MICROSAT LAUNCH STATUS REPORT

All seven payloads: four microsats, two UoSATs and the primary
SPOT-2 payload have been integrated and encapsulated in their
payload structure. The SPOT-2 has also been fully fueled and all
are awaiting mating with the Arianne vehicle which will occur in

a few days

The microsat batteries are being trickle charged, 10 hours on and 14 hours off per day, by Dave Cowdin, WD0HHU who will be in Kourou through launch day. This is done so that the onboard computers will remain powered up and retain their software loads in preparation for early flight operations.

Although separation from the launcher physically connects power to the microsat transmitters, they will not actually be turned on until a few hours after launch by either NK6K operating W6TRW on the U. S. west coast or N4HY on the east coast.

A prelaunch keplerian element set useful for all seven payloads will be published next week.

Rudimentary telemetry software for IBM-PC and compatibles is being prepared at this time and will be available soon. Distribution will be first to command stations and Command Station Development Program members followed by availability from AMSAT Headquarters and various electronic sources. If you do not have your software in place on launch day, simply capture files of received data for later processing.

Monitor the following frequencies early in the mission:

LUSAT 437.150 PSK (straight PSK transmitter)
LUSAT-CW 437.125 CW (modified character set)
WEBERSAT 437.075 PSK (raised cosine transmitter)
PACSAT 437.025 PSK (raised cosine transmitter)
DOVE 145.825 FM packet

Monitoring of the PSK signals will require an SSB receiver and a TNC-2 modified with a 1200 baud PSK demodulator. FM packet from DOVE may be monitored with an unmodified TNC and FM receiver. The LUSAT CW beacon transmits telemetry values in Morse Code om which numeric characters have been modified in order to save CW transmitter power. In all cases, more information will be published as it becomes available from the spacecraft development team. Copy CW signals as heard and capture packet telemetry into computer disk files for later processing.

Additional information including other downlink frequencies and the uplink frequencies will be released as "opening day" for each of the satellites nears.

AMSAT LAUNCH INFORMATION NETWORK

HR AMSAT NEWS SERVICE BULLETIN 001.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

MICROSAT / UOSAT LAUNCH NETWORK PLANS

For the planned launch time of 0135 UTC on 11 January 1990 (Wednesday evening, 10 January in the U. S.) the AMSAT Launch Information Network (ALINS) will run from 0100 to 0230 UTC.

The following stations will be carrying the event on HF:

Call Location Frequency Beaming

W1AW Connecticut phone bulletin Europe
frequencies,
see QST

WA3NAN GSFC, Maryland 14.295 USA
3.860, 7.185

W5RRR JSC, Texas 14.280 Central, South America,
3.840 and Caribbean

W6VIO JPL, California 21.280 New Zealand / Australia
3.850 or Japan / Asia

South Africa 3.718, 7.080, 14.282 (SSB)
3.665, 7.094 (AM)

In addition, an uplink to AO-13 (over Asia) will be provided by I2KBD near Milan, Italy, and an uplink to AO-10 (over South America) will be provided by W5RRR. Operations downlink frequencies of 435.970 and 145.950 will be used on the satellites.

Due to physical constraints imposed by the required orbit, the launch windows are very short (around ten minutes in length). If the launch occurs on another day, it will still be at roughly the same time of day and the ALINS schedule will also be similar.

The teleconference bridge, arranged with the aid of the ARRL headquarters staff, still has several available slots for interested repeater operators. To reserve a slot, contact Courtney Duncan, N5BF, at 818-957-8455 as soon as possible. Be prepared to leave your name, call, address with zip, phone number, repeater call, frequency, and coverage area on an answering machine when calling. The machine will be on-line 24 hours a day until reservations close late this week. Keep in mind that users of the bridge will be calling in at their own long distance expense on launch day.

Those who have reservations will be mailed the telephone number and other last minute information as soon as it becomes available. If time is too short, contact will be made by telephone.

PRE-LAUNCH MICROSAT KEPLERIAN ELEMENT SET

HR AMSAT NEWS SERVICE BULLETIN 001.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

SPOT-2 / MICROSAT / UOSAT KEPLERIAN ELEMENT SET

The SPOT-2/Microsat/UoSat launch window for 11 January 1990 opens at 013525 UTC and closes ten minutes later. Bob McGwier, N4HY, has provided the following element set which should be valid for launch anytime during the window (excepting the mean anomaly, which may need to be adjusted by a few minutes if launch is at other than 013525 UTC). If the launch occurs on another day, simply add 0.98561226 degrees of RAAN per day to the listed value, and adjust the epoch time by the amount that launch is different from 013525 UTC, leaving all other parameters the same.

Following deployment, all seven satellites will be in close proximity for several days. In about a week, users with high gain antennas will begin to find the cumulative errors per satellite growing large enough to cause significant pointing errors. All users will begin to notice the changes in AOS and LOS time.

The element set given is valid for all of the satellites but they will drift apart at the rate of several minutes in orbital position per week. Early in the flight, the estimated element set can be patched for individual satellites by adjusting the mean anomaly by a corresponding number of minutes. For instance, if after one week, PACSAT appears three minutes later than predicted by the element set, simply add three minutes (0.0020833 days) to the mean anomaly given to obtain better predictions. Actual orbital element sets for each new satellite will be made available as soon as possible.

Satellite: SPOT-2, UO-D, E, Microsat-A, B, C, D
Catalog number: not yet assigned
Epoch time: 90011.0816319

MICROSAT AND UOSAT FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 001.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

MICROSAT AND UOSAT FREQUENCIES AND DEPLOYMENT ORDER

The following are the Microsat and UoSat listening frequencies
and modes listed in order of deployment. The OSCAR numbers
listed are, of course, tentative and assume a successful launch
on schedule.

Spacecraft OSCAR number Frequency, MHz Mode

UoSat D UO-14 435.070 9600 bps AFSK AX.25
UoSAT E UO-15 435.120 9600 bps AFSK AX.25
PACSAT PO-16 437.025 1200 bps PSK AX.25
DOVE DO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT WO-18 437.075 1200 bps PSK AX.25
LUSAT LO-19 437.150 1200 bps PSK AX.25
LUSAT - CW LUSAT 437.125 12 WPM CW telemetry

Packet transmission from DOVE may be monitored with an unmodified
TNC-2 or clone, using an FM receiver. The other microsats
(PACSAT, WEBERSAT, and LUSAT) require an SSB receiver and TNC
with a 1200 bps PSK demodulator (FO-12 compatible, NOT the 400
bps PSK demodulator used with AO-10 and AO-13). The 9600 bps
modulation scheme used by the UoSats is compatible with K9NG and
other similar 9600 baud modems commonly used in terrestrial
packet applications.

Bob McGwier, N4HY, will attempt to activate microsat transmitters
on the first orbit after separation. The pass he will use for
this attempt will begin at about 0329 UTC on 11 January 1990.

SB ALL @ AMSAT $ANS-001.04
HINTS FOR MICROSAT/UOSAT RECEIVING ANTENNAS

HR AMSAT NEWS SERVICE BULLETIN 001.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

MICROSAT ANTENNAS CONSIDERED

Drawing on previous studies of ground antennas for low earth
orbit satellites and operating experience, Dick Jansson, WD4FAB,
has designed and theoretically analyzed performance of an antenna

which is thought to be optimum for microsat work. Essentially, the antenna is a fixed, dual band J pole with two feedlines.

Details of the antenna design and analysis will be published in the February 1990 issue of the AMSAT-NA Journal.

Users of AO-13 class satellite stations using the gain antennas to track microsats will experience in some cases up to 50 dB of excess link margin. The nature of the PSK transmission mode from the pacsats is such that excessive signal can actually make acquisition and demodulation more difficult. In any case, there is plenty of signal available to cover losses incurred from the use of fixed antennas and polarization mismatches.

Microsat users, particularly those intending to set up automatic mail forwarding or data capture installations are encouraged to use fixed antennas so as to reduce automatic system maintenance and wear to a minimum. Automated ground stations requiring significant maintenance are likely not to be able to support much long term use.

For fixed antennas, Jansson recommends a vertical arrangement, such as the dual J-pole design, over turnstile-reflectors and other traditional horizontal or circular designs.

Simple, low gain vertical antenna radiation patterns closely match that required by low orbit satellites at various slant ranges and corresponding elevation angles. This is particularly true near the horizon where the most gain is needed and the satellites spend most of their visible time. The drawback is linear polarization, but Microsat downlinks are circularly polarized so that the polarization mismatch is typically only 3 dB.

Turnstile-reflector antenna response drops off near the horizon where it is most needed and has peaks at higher elevations where low orbit satellites spend relatively little time.

For further details and dual J-Pole construction information, look for WD4FAB's article in the upcoming AMSAT-NA Journal. If you already have a simple vertical (quarter wave ground plane or vertical dipole) in place, it should be adequate.

Submitted by Courtney Duncan, N5BF.

SB ALL @ AMSAT $ANS-001.05
LUSAT CW TELEMETRY INFORMATION

HR AMSAT NEWS SERVICE BULLETIN 001.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

LUSAT CW TELEMETRY BEACON DETAILS

The LUSAT microsat carries as its special payload a CW transmitter which will operate at 437.125 MHz at about half of a watt. This experiment is separate from the remainder of the LUSAT (which is a pacsat). The telemetry encoded by it applies only to the CW transmitter module and is therefore unique and independent from the LUSAT telemetry transmitted on the 1200 bps PSK downlink (437.150 MHz).

The 12 word per minute transmission format is:

E LUSAT HI HI NL 111 222 333 444 555 666 777 888
where

E is an artifact of processing (for power measurement)
LUSAT is the spacecraft identifier
HI HI is the international CW identifier for OSCARs
N indicates which version of code is running from EPROM
(The firmware is stored 7 times in the EPROM to protect
against environmental degradation, so the range is 1-7;
the lowest non-corrupt version number is executed.)
L is "O" for "6805 OK" and "E" for "6805 ERROR"
(6805 is the RAM microprocessor.).

The following numbers are readings of the eight telemetry channels. All numerals are sent in "reduced CW" (extra dashes suppressed) under the following plan to save transmitter power:

A = 1 6 = 6
U = 2 B = 7
V = 3 D = 8
4 = 4 N = 9
E = 5 T = 0

The following equations are then used to convert the readings to engineering units:

CH# 1 = N1 +5 Reg. Voltage 636/N1 = volts
CH# 2 = N2 +10 Volt Battery 0.064*N2 = volts
CH# 3 = N3 CW TX Temperature 0.354(134.7-N3)= degrees C
CH# 4 = N4 CW TX Power Output (10.9+N)^2/40.1= milliwatts
CH# 5 = N5 Temp. BOX Nr. 4 0.356(136-N5) = degrees C
CH# 6 = N6 +10 V Current 0.7*N6 = milliamps
CH# 7 = N7 Panel +Z Volts 0.15*N7 = volts
CH# 8 = N8 Reg. +8.5 Volts 0.056*N8 = volts

A sample reception might be:

E LUSAT HI HI AO AUD A6B T4U A6U T4T A4D T4E AE6

This translates to:

E LUSAT HI HI 1O 128 167 042 162 040 148 045 156

NL = 1O : N=1 (first version) ; L=O (Memory 6805 RAM "OK")

N1=128: 636/128 = + 4.97 volts regulated.
N2=167: 0.064*167 = +10.69 volts battery
N3=042: 0.354(134.7-042)= +32.81 degrees C
N4=162: (10.9+162)^2/40.1=745.5 milliwatts
N5=040: 0.356(136-040) = +34.17 degrees C
N6=148: 0.7*148 = 103.6 milliamps (at 10 V)
N7=045: 0.15*045 = + 6.75 volts +Z
N8=156: 0.056*156 = + 8.736 volts regulated

WEBERSAT EXPERIMENTS AND MICROSAT TELEMETRY

HR AMSAT NEWS SERVICE BULLETIN 001.06 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

Now that the Microsats and UoSats are closed out and awaiting launch in Kourou, French Guiana, Microsat developers Jan King, W3GEY, Bob McGwier, N4HY, and Harold Price, NK6K, have been able to devote their holidays to the task of analyzing volumes of spacecraft test data, calculating telemetry calibration equations for each satellite, and preparing "first cut" decoding software. Also, WEBERSAT engineer Chris Williams, WA3PSD, has prepared an interesting preliminary document describing all of the WEBERSAT "attic" experiments except for the camera system. Besides allowing users everywhere to obtain satellite and experiment data firsthand, this information also has great educational potential.

Bruce Rahn, WB9ANQ, Command Station Development Program administrator, has compiled this and other information onto an IBM compatible diskette for immediate distribution to command stations and CSDP team members. Parts of the information will also be available from electronic sources such as CompuServe or the Dallas Remote Imaging Group BBS which is used by AMSAT-NA members.

Copies of the diskette will also be made available at AMSAT Headquarters (POB 27, Washington, DC, 20044, 301-589-6062) as soon as possible.

More refined information and software will become available as the operational phase of the Microsats evolves.

Submitted by Courtney Duncan, N5BF.

35. QSL managers for incoming foreign QSL cards

Newsgroup: rec.ham-radio
Date: 1990-01-03 13:29:13 UTC
From: dls@genrad.com
Message-ID: <30739@genrad.UUCP>
Source record: 14439

As a person who has now volunteered her services to help out with QSL cards, I figured that the information on how it's done might be of use to this net.

Basically, QSL cards are sent to the States in large packages (> 100 cards per package) from the various foreign QSL Bureaus. The cards are separated into 10 districts, corresponding to the digit in the receiver's callsign, at the foreign QSL bureau, then mailed directly to one of the 10 US QSL Bureaus. There, the cards are again sorted, this time based on the first letter FOLLOWING the digit. Each "letter" goes to a different volunteer person, who then further sorts the cards by callsign and mails them to the receiver. These volunteer persons generally pick up a bag full of cards to sort and send out about once every 4-6 weeks.

The envelopes which come in from the receiver again goes to the QSL Bureau (one of 10), where they are given to the volunteer for that particular "letter". At our QSL Bureau, the envelopes are "logged" in, and then sent on. This provides a method of tracing lost envelopes. If a Self-addressed Stamped envelope is enclosed requesting information or status, it is the "letter" volunteer who actually sends out the information (in general), not the QSL Bureau.

Now, down to the "letter" volunteer. The volunteer has a "shoebox" full of Envelopes. He also has a "shoebox" full of 3x5" cards containing the status for each callsign and any money/stamps which is sent. Each time a transaction is done for a callsign, it is logged on the 3x5" status card. Transactions include receiving envelopes/money/stamps, sending out QSL cards, buying envelopes/stamps for the callsign, sending out status information. He also has a "shoebox" to hold DEAD cards. These are cards which come in, but which he has no envelope/money/stamps for. The DEAD cards are held for up to 45 days, then are discarded.

There is ONE case where cards are NOT held for 45 days before being discarded. If he has a 3x5" status card on that callsign, and if a request has been made in the past TO that callsign to send in an envelope/money/stamps and no response has been received within 45 days, then the status card is marked "No Interest, Discard".....then any further cards are simply discarded immediately upon receipt.

At the volunteer's option, he can send out a postcard requesting an envelope/ money/stamps from the callsign. It is NOT required, and it does cost him (at least initially) 15 cents to send the postcard. Our QSL Manager has made up some postcards for this purpose. Generally, the postcards ask for a dollar amount GREATER than that required for just one envelope. If this money is received, the 15 cents is deducted from it, then the remaining amount is placed towards the callsign's "account". So now the callsign may receive

two or three envelopes before the "account" is out of money again. When the "account" becomes too low to send any more envelopes, the volunteer may request additional money to update account....else, it's back to the bit bucket again.

The "letter" volunteer does NOT make any money by doing this service. Somewhere along the line, he has to come up with envelopes and stamps (for those people who send money instead of SASEs). He has to come up with cash to buy 3x5" cards, pens, postage scale, tape, and any number of other supplies to support the service he provides. Many of the items can be obtained thru the QSL Manager himself, but there are always things the "letter" volunteer will have to obtain on his own. Some of this money is made up by the envelopes he sells to the callsigns. I was told to charge 10 cents per envelope or 3 SASEs (25 cents postage) for a dollar. Believe me, that leaves very little "profit" left over to buy supplies. The "letter" volunteer REALLY is just that: a volunteer. The QSL Managers are ALSO volunteers!

I hope the above helps to explain the incoming QSL Bureaus somewhat. I have some final advise to all hams out there:

1. If you ever have any QSO's with foreign countries, be sure you have an open account on file with your QSL Bureau. (Especially with Japanese QSOs, cuz they send a QSL card for everything!)

2. Send a 5x7" or 6x9" envelope to the QSL Bureau. Don't use small envelopes, the cards don't fit in them and they are difficult to keep track of. Same goes for 9x11" envelopes....they are difficult to keep track of. BE SURE TO PUT THE CALLSIGN IN THE UPPER LEFT HAND CORNER!!!! And self address it too.

3. Alternately (or in addition), send some money and/or stamps.

4. If you don't know what the status of your account is, ask. Simply send a self-addressed stamped envelope; almost always, they will respond.

5. If you change callsigns, you COULD send an envelope for both callsigns. But better would be to send it for your new callsign, but enclose a note of what your OLD callsign was. What we do for that is to keep a 3x5" status card with the new "letter" volunteer AND the old "letter" volunteer. When QSL cards are received by the old "letter" volunteer, they are simply returned to the QSL Manager who then gives them to the new "letter" volunteer (or sends them to a different QSL Bureau if that is appropriate).

6. If you change addresses and the address in the Callbook is not correct, send a note to your QSL Manager with the new address. Otherwise, the cards may end up getting disposed...when they are returned with "No Forwarding Address". Remember, the post office will only forward your mail for one year....no longer.

7. Keep in mind that most "letter" volunteers will NOT hold onto cards until they have a bunch to send you. If you only receive one card,

then that's what they put into the envelope. For this reason, it is better that you only put 25 cents onto the envelope, and instead enclose loose stamps or money if you think the envelope may weigh more than one ounce. Don't worry, that money/stamps will still be used for you, and not go into some volunteer's pocket. Don't get upset that some "letter" volunteer has taken postage OFF your envelope! He's doing YOU a favor by saving the excess postage for another time.

CHEERS!

Re: W1AW & QRM

Since W1AW is funded by a widely recognized association of Amateurs,
one might presume that W1AW's code transmissions might be
the best known of code practice sessions emanating from
the US. In this spirit, I would suggest that W1AW be given a little
bit of slack.

After all, I used their services to attain all my license grades over
the last 18 years. I would expect that many others are doing the same.

I do have trouble with others firing up as if they had some constituency
like ARRL's. Non-stop KJV might be more of a "ministry" than a
code practice session. Perhaps the proof could be as simple as
having the station licensee provide evidence that some minimal number
of people are actually copying the sessions.

While W1AW acts like they own a frequency, I think that they are
actually "more equal than others" in a very useful way. By moving off
their frequency, you may be assisting some wannabe-hams and demonstrating
why newcomers might like to join our ranks. Not moving off of a
KJV session might only get you some prayers for your evil soul....
and most of us can use all the help we can get :-)

W1AW, it's not really *their* frequency, it's OUR frequency.

ICOM R7000 Questions.
****

I am interested in hearing from people who have ICOM R7000 radios and have used or purchased the NOVELL FC7100B converter. Allows the ICOM R7000 to receive, according to the EEB add I saw, from 20khz to 2ghz. Cost of the converter is about $219 I think, not a bad price when hooked to the R7000 to get that reception range, if it works well.

Also, have users of the R7000 noticed LOTS of overlapping images of broadcast FM stations in the 70 to 87mhz range on the R7000 or is mine just busted? Does the 1GHZ switch on yours basically do nothing except drop the S-meter reading when turned on with a local FM Broadcast station tuned in? example. 93.7mhz then with 1GHZ switch in 1093.7mhz is displayed but the FM Broadcast guy is still good and strong; though the S-meter drops 20-30units.

Has anyone put a good quiet preamp in the 1691mhz range in front of the R7000, to receive the GOES satellites, in FM wide mode with ANY success?
****

PRO-2004 Questions.
****
I have a friend who had a PRO-2004 which has a continual problem in the audio. Radio Shack has been unable to fix it and has given him a PRO-2005 in exchange. Any comments on the relative merits of the two and does anyone have mods to open up the receive range, or other good stuff.
(yeah the cellular stuff :^).

Any comments on the above would be most appreciated. E-mail to me if you can, to keep the noise level on these groups down, or post a follow-up if you can't e-mail to me.

42. VERTICALS- Try a SLINKY !!

Newsgroup: rec.ham-radio
Date: 1990-01-03 19:29:08 UTC
From: pjstopa@CRDEC4.APGEA.ARMY.MIL
Message-ID: <9001031429.aa22087@crdec4.apgea.army.mil>
Source record: 14443

SMALL VERTICALS

Several years ago 73 magazine had an antenna, nicknamed the "Ramada Resonator", in their antenna issue. It consisted of a vertical slinky on a collapsible PVC frame which was fed via tuner like a long-wire. The PVC frame was collapsible, making the antenna easily transportable for those business trips and overnight stays in the Ramada.

Living in a townhouse development with strict covenants against antennas, I decided to build the thing. I eventually got rid of the PVC frame and used the slinky elongated out to about 6.5 ft along a 1"x3" driven into the ground. I fed it as both a long-wire and with coax, the ground side going to a quasi-radial system on the ground. I was able to load the thing with a tuner from 160 to 10 meters. Bandwith was narrow on 160 and 80, but the antenna loaded pretty well on the rest of the bands. With this set up, I worked plenty of DX, even on twenty, and my neighbors didn't suspect a thing. I did have a hy-gain vertical which I used before the slinky, but I did not see any dramatic difference between the two. Word of caution- The SWR does change if the slinky bounces, so try and keep it firmly rooted to the support. I have since moved the antenna to my attic without significant loss in performance. For a $3.00 slinky, it might be enough to get started.

BTW- several of you have e-mailed me about the Christmas train, saying that you had problems with it- could I remove such and such codes- etc.. The program was passed along to me on e-mail, so I am not initimately familiar with the codes, etc., to do as you requested. If the thing crashed your system, my humble apology is extended.

HAVE A HAPPY NEW YEAR!

de Peter J. Stopa, KA3LKQ

> 73 Magazine
> is going to have an article on scanners in a future issue, I hear,
> that will feature two modifications: 1.) how to use the scanner to
> measure FM deviation and 2.) how to use it to decode PL frequencies.

Here's a low-tech way to decode PL frequencies. Using a radio such as a Yaesu FT-23R with a built-in programmable PL decoder, merely program the frequency into the rig. Leave PL decode off and when the signal is active, turn PL decode on and slowly (about 2 seconds a tone) step through the various standard PL tones until you get audio out of the speaker! This may take a few transmissions to get through all the PL tones. (This is not a problem on the Ham bands where we ragchew forever!). An alternative approach is to program the same frequency into different memories but with different PL decode frequency in each one. The scanner will then stop at the appropriate one. My FT-23R doesn't have enough memory channels for this approach.

Remember you need to be monitoring the INPUT frequency of a repeater to hear the PL tones on most modern well engineered repeaters. Many times a notch filter is in the controller to prevent the PL tones from being heard on the output. Sometimes a different PL tone is used on output.

Please, no flames about using an audio frequency counter and all that. I said this was low-tech and it works!

Gary Wilson, WB2BOO

PS a simple way to get many ham PL tones is to look them up in the ARRL repeater guide! (100 Hz is most common).

44. Re: Assigned Radio Frequencies

Newsgroup: rec.ham-radio

In reply to the unsigned note (hard to email to) about
getting info on frequency assignments in the LA area, I
suggest you attend a mtg of the RCMA (Radio Communications
Monitoring Association). There are monthly mtgs in both WLA
and the Anaheim area. I don't have mtg details at my
fingertips, but you can listen to the Baldwin Hills ARC
19:30 Tuesday night net on 146.925. They generally have
info about RCMA mtgs.

45. TV and FM radio DXing

Newsgroup: rec.ham-radio
Date: 1990-01-03 20:37:23 UTC
From: trey@ut-emx.UUCP
Message-ID: <22960@ut-emx.UUCP>
Source record: 14451
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I have some questions for the TV and FM radio buffs of the net.

1) What kind of (presumably directional) antenna do you use in
your pursuit of DX?

2) Is there such a thing as an omnidirectional antenna for TV and
FM radio reception?

2.1) How are commercial (broadcast) TV signals polarized and
how does this affect the choices?

I live between markets and I get tolerable reception of about a dozen
TV stations on the indoor antenna clipped to the back of the set. I
would like put up a small omni to improve these pictures without having
to be bothered to rotate an antenna while madly exercising the remote
control. Another use of the omni might be to check channel two for
six meter openings and such.

I would also like to have a second antenna with some serious gain so
I can do some DXing.

Some other questions: is there such a thing as putting a TV antenna
"too high" (too high in the amateur sense, i.e. 0-200 feet) as with hf
antennas? If I run a KW on six or two meters, is it a bad idea to have
my TV turned on to channel 2? turned on to any channel? turned off but
still connected to an antenna? Also, if commercial antennas are the answer,
what is a good way to attach these tiny things to a 2 inch .25 wall mast?

Followups to me or the net. Thanks.

Trey Garlough

This has been hashed over many times, and the consensus seems to be:

1. The radio rebroadcast shouldn't go out over the air.

2. Therefore, you should either:

a: Disconnect from the patch

b: Transmit over the patch yourself -- something like "N0XXX waiting for patch answer" -- release intermittently to see if your party has answered.

3. The FCC would not be happy about the rebroadcast music/commercial, so don't try to collect fees :-) :-). (But I won't turn you in.)

My recommendation for California scanner owners
is to buy a copy of Robert Kelty's publication
called Government Radio Systems. It breaks down local,
regional, state and federal radio systems in fine
and accurate detail. He also produces a smaller
book called Military Radio Systems, which I wouldn't
recommend buying immediately.

You should be able to find this in any good scanner shop.
Try Ham Radio Outlet if that doesn't work.
It costs about 20.00 but it the best researched
directory for California I have seen. I have not
seen a good directory for private sector (business)
frequencies.

49. Sony 2010 modification info

Newsgroup: rec.ham-radio
Date: 1990-01-03 22:11:01 UTC
From: hcooper@esunix.UUCP
Message-ID: <1714@esunix.UUCP>
Source record: 14448
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I came across this on a BBS today, and I am not sure if this is already known to owners of the Sony 2010, so I am posting it.

I don't own one of these radios, so use at your own risk.

The sony 2010 has a design flaw that causes static electricity to blow the first RF stage. Sony is aware of the problem, and has for some people, repaired the problem at no charge. They may or may not still be doing this. The amount of static charge required to blow the stage can vary from a thunderstorm, to build up due to dragging your feet across the carpet.

Second posting of information related to the Sony 2010

Apparently the built in whip antenna does have protection diodes on it, but these are by-passed when plugged into the external antenna jack. To protect the input when using the external jack, place 2 1N914 diodes in series, then two more in parallel, but back biased.

```
----|<----|<---- ground
antenna ---->|---->|----
```

connect the setup from the input to ground. This will allow either a positive or negative charge of more than 1 volt to bleed to ground. the original poster of this has seen NO negative affects to reception.

This is all the information I have on the subject.

Not me, but I've got a general question about them. If you've got a
vertical antenna, then you've got an omni-directional pattern. Does
an HF vertical behave like a VHF vertical does, namely in terms of
a flatter angle of radiation? If so, does this give you a longer
skip? And is only the first skip affected, or will the second (third...)
hops be lengthened, too?

On the lower bands, like 80m, where a full-size vertical dipole
would be "a really neat trick", does this fall apart because of
loading coils, etc.?

I've had the same thing happen to me numerous times. It wasn't so
bad, since it was my repeater I was using, and we don't have many
users. However, I think it is illegal to rebroadcast commercial
radio. Then again, maybe not, because it is unintentional. You could
always just hang up, call them back, and leave a msg to have them call you.
If it appears that you won't be on hold more than about 30 secs, I
wouldn't worry about it, but if it is more than that, I would just
hang up.

My ICOM-701 HF transceiver has been giving me a funny popping noise.
It comes at random yet frequent intervals. This popping noise is barely
audible in the audio unless the audio is cranked up high. It is accompanied
by an aparrent de-sense of the radio to incoming signals.

I thought at first that the band (usually 10m) was fading frequently,
however, I soon noticed it happening on all bands, & then I noticed the
popping noise. It is easy to duplicate now as I turn the rf-gain all the
way down & turn the audio up. There it is. It doesn't appear to be the
audio stage as the cw sidetone is not affected by the popping.
The S-meter is appears to be uneffected by the popping, however, I'm not
certain of this yet. It appears that the radio remains on frequency, although
it appears to sweep 50-200 hz or so at times. This might rule out the PLL
(or it's voltage supply)

Some history. I recently purchased the radio at a hamfest known DOA. My
suspicions were the PLL and, with that, I sent it off to ICOM. The problem
turned out to be a DC-DC converter (DC-2?) for the -9V reference supply (for
the synthesizer op amps, etc). Now, when it went, it also took out a small
resistor. (4.7 ohm, 1/4 watt). We don't acutally know which went first.
I don't know whether it was doing this when it returned as I was happy
with my "new" "bargain" radio & it worked fine esp with strong signals. BTW,
the signals "appear" to drop out by 3 db. Sometimes more.

My suspicion is that the problem is a capacitor which is charging relatively
slowly (time constant 1 second) until it reaches a breakdown threshhold and
discharges. The discharge (short) interferes with the -9 supply & causes the
signal problems. The cap probably was toasted by over voltage when the
converter went out. Or, perhaps, a defective cap caused the coverter to go.

Anyway, any ideas? Also, tips on isolating the component would be appreciated.
I can get access to a 30 mhz scope, but probably not much else (computer
service dept at work). I could also use my backup HW-101 as an rf signal
source.

BTW, the noise isn't really a sharp pop - more like a pop followed by a
brief static rush. It's kind of like listening to frequent lightning strikes
on the radio. BTW, it isn't that as it does it w/o the antenna & w/o the storm.

I think both the music and the ad would be considered a violation
by the FCC. My understanding is that standard procedure in these
situations is to hit the "hangup" code as soon as you hear the music.
If I recall correctly, the ARRL Rule Book recommends you not use the
autopatch to call a business number for this very reason.

Our local repeater group does not like music on hold on autopatches,
and tells the users to terminate the patch if this happens, claiming
that it is illegal.

My personal opinion is that the music is incidental to your autopatch
communication, and so you aren't engaging in broadcasting.

However, I notice that the new Pt 97 states "No station shall transmit
...music."

The issue of using broadcast radio audio on telephone systems is drawing lots of attention here in the Los Angeles area. Possibly because of the closeness to Hollywood and the recording industry.

We just purchased the new AT&T Definity telephone system this Summer. The AT&T installation crew refused to connect the system's music-on-hold input to a radio station. We started using a compact disc player a few years back. Not only does it give probably the best sounding music-on-hold in all of Santa Monica, but we also don't have to worry about commercials and having people accuse us of supporting the views of a particular radio station since we are a sub-division of the State of California.

I understand your frustration when you get Dominos Pizza on your repeater. I'd blame it on the girl's boss at her company.
That is unless you have a second date in your future.....

60. Decoding PL Tones

Newsgroup: rec.ham-radio
Date: 1990-01-04 12:23:02 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <9001041223.AZ00041@adam.DG.COM>
Source record: 14463

CEO summary:
One problem with decoding PL tones by the "trial and error" method of enabling PL decode on your rig and then switching through all tone choices is that there are more possible PL tones than most rigs have choices. My 1988 ARRL handbook lists 42 of them, from 67.0 Hz to 254.1 Hz. Most rigs support 32 or so (the Communications Specialists chips have 32 EEPROM locations into which they can program *any* frequency you choose, not just the standards) of these.
There was a construction article in 73 magazine a few years back (I'll try to find the reference) that used a PLL to lock onto a harmonic of the received tone and displayed the tone frequency (I think it was the 10th harmonic). They cautioned you that you have to tap into your rig before the de-emphasis network in order to get un-attenuated PL audio.

Our 2 meter repeater passes PL (Motorola's trademark, by the way, stands for "Private Line". The official term is CTCSS, for Continuous Tone Coded Subaudible Squelch) tones so that the users who don't want to listen to the channel chatter on the machine can tell their friends which PL tone they should use to turn on their receiver.

61. Or dryer hose ...Re: VERTICALS- Try a SLINKY !!

Newsgroup: rec.ham-radio

...
>I eventually got rid of the PVC frame and used the
>slinky elongated out to about 6.5 ft along a 1"x3" driven into the ground.
...
>I was able to load the thing with a tuner from
>160 to 10 meters. Bandwith was narrow on 160 and 80, but the antenna loaded
>pretty well on the rest of the bands.

After constructing my pudgy wound vertical (4' by 4" 48 turns) for 31 meters I went out to the garage and almost tripped over the dryer vent hose. Further exploration showed it to be a vinyl coated wire helix.

Off to the hardware store... An hour or so later I had a 4 inch diameter 4 feet long (five if you REALLY streched it) coil. The wire looks like copper coated iron. It had about 48 turns. Depending on how much it was streched it made a decent antenna for 49 through 31 metres. Takes about $5 and not much time or work ... but it isn't as high class as a PVC pipe with solid copper wire on it. It does fit in a coat pocket though ... It also made an OK radial for another helical vertical.

Use last year's output of INFO-VAX for a one time pad :-).

It is essential that the data used as a key be totally random in nature.
INFO-VAX is pseudo-random at best, which is not good enough.

63. AutoExam now available on SIMTEL20

Newsgroup: rec.ham-radio
Date: 1990-01-04 15:22:32 UTC
From: rbono@necis.UUCP
Message-ID: <1200@necis.UUCP>
Source record: 14476

****

Due to many requests, my current version of AutoExam has been uploaded to
the SIMTEL20 archive site. Thanks to Keith, it is now available as:

PD1:<MSDOS.HAMRADIO>AUTOEXAM.ZIP

This program and the included databases will generate an exam from Novice
to Extra. Each exam is different, even the answers to the questions have
been randomized to help prevent memorization, and to promote learning the
correct anwser.

This program should run on ANY MS-DOS or OS/2 computer (yes it is one of those
bi-sexual... oops, I mean bi-modal programs). This version does NOT make
use of any fancy graphics, or colors (this makes it compatible with DOSGATE
to allow it to be used via packet radio by anyone).

Because of the lack of graphics (at this time), some questions from the
pools that deal with schematic diagrams are either very crude, or missing.
Later versions may be upgraded to fix this limitation.

Instead of waiting until I have the time to update this, and get all the
latest question pools included, I thought I would make it available to
those who need it. Even with some of the question pools just out of date,
it is still usefull for studying use. When the question pools are up-to-date,
it can be used to generate printed exams for use by VE's.

The program can be used in a couple of different ways:

1) Interactive exam, gives grade when complete.

2) Printed exam and exam key, useful for classes, or for practice.
(I have used this feature extensivly (sp?) in my Novice classes)

3) Print study guide, this prints each question in the pool along with the
correct answer, to allow use of a simple 'pocket' study or refesher guide.

This is NOT shareware, or in the public domain. But I DO allow it to be
copied and given to others FOR NO COST to help promote and help with those
interested in attaining thier Amateur Radio license.

Get a copy of this and give it to all your friends who would like to see if
they are ready for an exam. It's surprizing how many people can pass these
exams if they would only give it a try.

For those without access to SIMTEL20, I have also uploaded a copy of this
program to a BBS in MA (508) 688-1348.

64. W1AW & QRM

Newsgroup: rec.ham-radio
Date: 1990-01-04 16:33:21 UTC
From: doug@NISD.CAM.UNISYS.COM
Message-ID: <9001041633.AA13667@KRONOS.NISD.CAM.UNISYS.COM>
Source record: 14333

Many years ago, when I got started, the W1AW ops looked for a quiet spot on each band before firing up the transmitters. As a result, you never knew where they would be. If there was any activity on the band, it could take 5-10 minutes to find them. By then, the slow speed code was over and the effort wasted. It got very frustrating some times.

Try making WAS on only 2 bands when in the East. It can be done, but it is neither easy or quick. With only 100w, I finally had to string a wire through the trees at night (military installation) and wait for 40 to be open from MD to the north east. If you restrict to 2 bands, there will be significant portions of the country that won't have reception.

Message-ID: <9001041448.AA00497@nips.ssesco.com>
Source record: 14336

I don't see a mod on HAMSTER for enabling the crossband repeater
action on the new Kenwood TM-701a 2m/70cm rig. Does anyone
know how to do this? and how to turn it on once the mod is performed HI!
There's plenty of stuff on -721 and -731 relating to this...but
nothing for -701 (probably because it is fairly new...) Several
people have mentioned that the radio is capable of it (I hope
so, I just ordered one!) but aren't able to produce the mod info--
Any clues would be appreciated...

Thanks and 73, Chris N0JCF

66. the dsp in Kenwood TS950

Newsgroup: rec.ham-radio
Date: 1990-01-04 16:49:41 UTC
From: datwyler@esunix.UUCP
Message-ID: <1715@esunix.UUCP>
Source record: 14464

Without looking at the QST/Ham Radio magazine adds for the Kenwood TS950, and remembering not what the ICOM adds contain, I suspect that Kenwood is not using a digital filter at audio frequencies, but is really using direct digital synthesis to get l.o. signals. This is the claim of a spectrum analyzer picture in the add. From my small understanding of the stuff inside, you can filter the audio and i.f. as much as you want, but if the l.o. is not clean, the output from the rig will still be junk. That is why I suspect that Kenwood pulled a marketing ploy, calling DDS (direct digital synthesis) DSP, so as not to be confused with ICOM.

Thank you for your kind attention.

From: pgraham@wyse.wyse.com
Message-ID: <2574@wyse.wyse.com>
Source record: 14328

I just got off of the phone with kenwood customer service. There will be a new display for the TM-721a and TM-621a. It will only improve the display and will not add any 731a or 631a features (other than being able to read the display in bright light).

Cost of the modification will be 30 bucks (so I was told). The modification can not be done by most hams since a LCD display, and ribbon cable has to be removed / re-attached. (I think I could do, but who knows)

The modification should be available at the end of January (some delays in shipments).

That is all I know...

I agree. It's the best scanner freq book I have yet seen and if you had to
choose to have only one book, this would be my choice.

72. Software Control of Kenwood Radio

Newsgroup: rec.ham-radio
Date: 1990-01-04 19:06:50 UTC
From: barry@dgbt.uucp
Message-ID: <1346@dgbt.uucp>
Source record: 14467

A local ham has asked me for help in finding software he can run on his PC which will allow him to control his TS-440S. Apparently Kenwood will happily sell you a serial interface adapter for the radio, but can't, or won't, supply any software. This fellow has no programming experience and is not interested in trying to roll his own. Anybody got any leads?

I received a nifty, if somewhat scratched, FT-727R dual-bander for Christmas,
and I'd like to know what mods are available. As best as I can tell, it has
the C CPU, but I could be wrong.

Any replies will be most welcome.

This is a great document. The 1990 version doesn't have federal frequencies;
he's putting out another one that has just those (I think). The CA stuff
is also available on floppy for ~$50. I have the floppy version & it's
great for grepping...

Sounds like something is being detected by your AGC (Automatic Gain Control)
circuit. These circuits usually have a "fast attack" to suddenly strong
signals and a "slow decay" that occurs after the signal. Possibly some
noise either at the antenna input or, if it's not "external noise",
possibly something in the RF amp. section of the receiver is generating
the noise. Try grounding the antenna with a short piece of wire to
go through the good ol' "process of elimination" to determine whether
it's internal or external.

Good luck,
WB6JZL

This is done to provide maximum coverage. Whereas you might find
tranmissions from Connecticut on 7 MHz at midday to be useless, a
person in Maryland might find 28 MHz transmissions at that time
equally useless.

79. Listing of "PL" tones

Newsgroup: rec.ham-radio
Date: 1990-01-05 00:27:47 UTC
From: lawrence@smcnet.UUCP
Message-ID: <501@smcnet.UUCP>
Source record: 14330
Cross-posted to: rec.ham-radio,rec.radio.shortwave

In response to the questions asked about "PL" aka CTCSS....

Continuous Tone Coded Squelch System (CTCSS) is a common way of coding two-way radio gear to allow selective calling of radios in the same organization. ie: Units with the same CTCSS code will be able to communicate together. CTCSS is also known as "PL" in Motorola gear, "Channel Guard" in General Electric gear, and "Call Guard" in E.F. Johnson gear.

How it works:
The transmitting unit generates a tone that is broadcasted along with the voice signal of the radio. The receiving unit recieves the tone and opens the radios squelch circuitry if the tones match each other. Most radios put a high pass filter in the audio output statge to filter the CTCSS tone out of the audio. In urban areas and on commercial bands there is usually more than one organization on an assigned frequency. The CTCSS encoding method keeps the two organizations from hearing each other's transmissions. Since there is still only one radio frequency that these two groups are sharing, if both groups key their radios at the same time and are geographically close to each other, they will cause interference and usually nobody hears anything.

Motorola assigns a 2 letter code for ease of remembering the different codes. Here is a list of the CTCSS tones in Hz and the Motorola "PL" code.

67.0 XZ 69.3 WZ 71.9 XA
74.4 WA 77.0 XB 79.7 WB
82.5 YZ 85.4 YA 88.5 YB
91.5 ZZ 94.8 ZA 97.4 ZB
100.0 1Z 103.5 1Z 107.2 1B
110.9 2Z 114.8 2A 118.8 2B
123.0 3Z 127.3 3A 131.8 3B
136.5 4Z 141.3 4A 146.2 4B
151.4 5Z 156.7 5A 162.2 5B
167.9 6Z 173.8 6A 179.9 6B
186.2 7Z 192.8 7A 203.5 M1
206.5 8Z 210.7 M2 218.1 M3
225.7 M4 229.1 9Z 233.6 M5
241.8 M6 250.3 M7 254.1 OZ

Motorola also has a Digital "PL" system that uses a digital code instead of an audible tone. Last I heard, Motorola will guarentee that their Digital PL will keep other groups out of your radio system but they won't guarentee the older "PL" tone system.

From: wheatley@cbnewsk.ATT.COM
Message-ID: <1740@cbnewsk.ATT.COM>
Source record: 14472

I am likely to head to Macau XX9 in late February, and want to take along a 40/80 meter vertical to work the low bands in the evening (rather than sleep!) ... my last trip there made it painfully clear that most of Europe and everone else needs XX9 on 40/80.

Last trip we tried shortened dipoles in a sloper fasion, with little luck.

Here is the catch, this needs to be mounted on an elevator penthouse or roof of a 23 storey building. The roof area is rather small, so there isn't much hope for radials, but the entire building is loaded with 'rebar'...so there is lots of metal.

I have used a 5band butternut without radials at an apartment by just planting it in the ground. It worked pretty well. Anyone have any suggestions? I am thinking about a 40/80 BUtternut....any and all advise is welcomed with open arms.

Oh yes, I am trying to plan the trip to be in XX9 for the ARRL DX SSB contest first weekend of March. If this works out, I will post something further. I also plan to operate from VS6, HS, and 9V. The call for the contest will be XX9SW, if this all works out....look for you on the bands!

>Are there any international considerations ? Are we bound by ITU to the
>silly 3KHz bandwidth, or is that a hell of our own design ?
>
Well in the UK, (and i suspect a fair bit of Europe too) adherence
to the bandplan is entirely voluntary.......
There are 'gentlemens agreements' not to use certain modes on certain
frequencies, and *most* people stick to them.
You will not get put off the air for running packet on 14313, or
double-sideband-with-full-carrier (or 'AM' as we used to call it) in the
CW 'segment'.
Equally, you will not make many friends!
The restrictions on licensed data emissions are also much less strict - we
have no worries about whether we are running 7- or 8-bit ASCII, AMTOR,
genuine HDLC (in which the bit-stuffing makes any considerations of
'parity' on a character-level irrelevant), SDLC, 6-bit BCD, or any other
home-grown protocol, encrypted or not. There used to be a net of people who
used 'Hellschreiber' machines (second-world-war enciphering teletypes!),
these things were designed to encrypt, like an 'enigma' machine.
As long as you identify in CW every 15 minutes, you will get away with it.

Pete

84. *Yet Another Ground Rod*

Newsgroup: rec.ham-radio
Date: 1990-01-05 15:10:19 UTC
From: fletcher@OUTLAW.UWYO.EDU
Message-ID: <900105081019.2020126c@UWYO.BITNET>
Source record: 14338

For anyone serious about getting a *REALLY* good ground from a self installed ground rod, and maybe picking up some additional understanding about how ground rod performance can be affected by different soils, I would like to suggest reading the following:

BENTONITE RODS ASSURE GROUND ROD INSTALLATION IN PROBLEM SOILS
by Warren R. Jones,
IEEE Transactions on Power Apparatus and Systems,
Vol. PAS-99, No. 4 July/Aug 1980.

The title is a little deceptive because you don't actually sink a ground rod composed of bentonite into the ground. The paper describes a process wherein you drill a hole in the ground of some reasonable size (e.g. 4-6 inches), place a metallic ground rod in the hole, backfill the hole with crushed bentonite, then flood the hole with water. The bentonite will absorb a great deal of water and swell to a volume that is something around 13 times it's original volume in the process. As I understand the paper, ground rod performance can be improved if the surface area of the rod in contact with the earth is maximized. Bentonite is composed of various chemical salts that form a nice ion-rich conductive bedding. In addition, the bentonite swells to fill all the interstitial space in the hole. Because bentonite is itself very conductive, it apparently "artificially" increases the diameter of the installed rod to that of the hole.

The paper describes various field tests and the obtained results and is intended to address problems with soils considered difficult to achieve good grounds for various reasons. I got the idea however, that the method should improve your ground system no matter what soil you were working with.

And finally, yes I installed a rod as described in the paper. I needed the help of several other hams, mostly because the hole was drilled using a portable (post-hole?) drill. The hole diameter was 6 inches and was 8 feet deep. I used a 10 foot by 5/8 inch copper-clad iron rod. I used several bags of crushed (not powdered) bentonite. The uses listed on the bags were "for ground rod" installation and some other unrelated things. The rod was loose in the hole initially, but after a day or so of soaking up water, became so tight that I could not turn it with a pipe wrench. The soil at my QTH consists of about 2 feet of clay underlain by fine sand. I have a high water table at my QTH, varying seasonally from around 5 feet to 8 feet, so I didn't have to add much water. Bentonite is very hydrophilic and will tend to keep itself hydrated. Sometime in the next year I will install another tower at my QTH, at which time I will put another rod in using the described method. I have a second rod in the ground installed the conventional way. After the third rod is in, I will make some (probably not entirely scientific) measurements to determine if the method makes a measurable difference. For now, I can't say

whether I gained anything from the effort other than some baseless peace of mind. I didn't consider it that much extra effort, but I did have help (Thanks, guys!).

From: ENGE@IBM.COM
Message-ID: <010590.075845.enge@ibm.com>
Source record: 14339

I once worked for the FCC as a Student Trainee Engineer. A standard item of equipment in the investigative cars was a huge wooden circus mallet. When I asked what this was for, I was told that when looking for electrical interference, the investigative engineer would drive along the powerline right of way, stopping at each pole and giving it a good whack with the mallet. Often the interference was being generated by a cracked insulator, and the vibration caused a change in the noise level.

Of course, that was in the days when the FCC was concerned about such interference. Sigh!

You might try the same thing on a smaller scale. Take a portable radio to monitor the noise level, and go along the powerline near your house banging the pole with something heavy. Once found, your next problem might be convincing the power company to fix it.

DF-ing with an AM radio is, well, difficult. W8VR taught me to use the highest frequency that the noise is hearable on- this means, in practical terms, using a 2m radio (preferably SSB) and a small beam. Using this technique we tracked down a noisy powerline insulator 1 mile away in about 15 minutes. With an AM radio we'd be wandering around the line of poles- if we even got that far- with no indication of where the problem was originating. To that basic outfit I'd add, of course, a variable attenuator to knock the signal down.

That would have seemed to me to be the first way to do it. One might also try logarithmic conversion ahead of the ADC, if that won't complicate the DSP processing too much (but it might). In the AGC route, the DSP itself should be doing the determination of the AGC levels, too.

Our local repeater organization clearly feels that this is a no-no wrt music on hold. I often like listening to music cranked in the car but I am VERY carefull to turn the AM/FM radio OFF before I hit the PTT on my rig in the car. In both the ARRL handbook and the local repeater handbook they specifically state that you are not recommended to phone a commercial establishment (for several reasons, music on hold being one).

When I see incorrect practices around here, I usually inform the user about the repeater user manual supplied by the club and that it is supplied for free to ensure proper operating practices. It is good reading since it tells about the details about the repeaters that will provide higher performance out of the system (linking, autodial etc.).

For FM, yes. But you'll find that every hill, skyscraper, semi-truck,
containership, or airplane going by will contribute to your signal.

>
> 2.1) How are commercial (broadcast) TV signals polarized and
> how does this affect the choices?

Most are horizontally polarized. If they are using circular polarization,
which can reduce ghosts, they make a big deal about it (It costs them more),
and special antennas are usually available locally.

Off of my book shelf:

TV Antennas and Signal Distribution Systems
M. J. Salvati
Sams ISBN 0-672-21584-5

He did an antenna study for Sony, and this is full of antenna comparisons.
It's 10 years old, but the field hasn't changed much.

INFORMATION AS OF 05 JAN 1990

!!!!!!!!!! INFORMATION SUBJECT TO CHANGE !!!!!!!!!!

********** ********************
* PAGE 1 * * WINTER EVENTS *
********** ********************
********************************************************************************
Massachusetts
CLUB: MMRA EVENT: FLEA MARKET
PLACE: Westboro Senior High School DATE: 13 Jan. 1990 (Sat)
DEALER SETUP: 0830 OPEN TO PUBLIC: 0900-1400
ADMISSION: $2.00 TABLE PRICES: $10.00 in Adv. $13.00 Door
TALK-IN:146.01/.61 REFRESHMENTS: YES
OTHER NOTES: To get to the event from I-495, take Rt 9 West 1.5 miles to the
bottom of the hill. Exit right onto Rt 30 West, "Westboro". Proceed 1.8 miles
going straight through the circle to stay on Rt 30 West. The Westboro
Senior High School will be on your left 1/3 of a mile West of the circle.
For advance reservations or offers to help out please contact Scott Bullock
KA1CLX 26 Willis Street, Apt. 21, Framingham, Ma. 01701. (508-872-4961)
Tables are $10.00 in advance or $13.00 at the door (last years prices).
********************************************************************************
MASS
CLUB: Algonquin Radio Club EVENT: Flea Market
PLACE: Marlboro Middle School DATE: 17 Feb. 1990(Sat)
DEALER SETUP: 0800 OPEN TO PUBLIC: 1000 to 1500
ADMISSION: $2.00( last year's price) TABLE PRICES: #8.00 and $10.00 at door
TALK-IN: 146.61/.01 and .52 direct REFRESHMENTS: Yes
OTHER NOTES: Note Change in day (Sat instead of Sun) The flea Market will
be held at the Marlboro Middle School off Thresher Street. There was much more
room last year, so I assume there will be the same this year. For more info
call KB1WW at 508-481-1587. Make checks payable to Algonquin Amateur Radio
Club, P.O. Box 258, Marlboro, Ma. 01752.
********************************************************************************
New York
CLUB: Metro 70cm Network EVENT: Flea Market
PLACE: Linclon High School DATE: 21 Jan. 1990 (Sun)
DEALER SETUP: OPEN TO PUBLIC: 0900-1700
ADMISSION: $3.00 TABLE PRICES: $12.00 for a 3X5 Table
TALK-IN: REFRESHMENTS: FREE coffee all day
OTHER NOTES: The event is at the Linclon High School, Kneeland Ave. Yonkers,N.Y
There is FREE parking, NO TAILGATING, (Indoor Fleamarket only).
Table reservations must be pain in advance and a limited number of tables are
available. If you bring your own table the cost drops to $1.25 a foot.
```

Reserve space in advance. One person admitted free for every 5 feet of table space. FULL PAYMENT IS DUE IN ADVANCE (When reservation is made).
For more info contact Otto Supliski at 914-969-1053.
****
Vt

CLUB: BARAC?? EVENT: 8th Annual FLEA MARKET/AUCTION
PLACE: Milton H.S. Milton, Vt. DATE: 24 Feb. 1990
DEALER SETUP: 0830 OPEN TO PUBLIC: 0900 to 1500
ADMISSION: $2.00(under 18 is FREE) TABLE PRICES: No extra charge
TALK-IN: 145.47/146.85 REFRESHMENTS: YES
OTHER NOTES: The event is at the Milton High School, Route 7, Milton Vt. ON I-89 the Milton exit is 4 miles north of exit 17 and 5 miles south of exit 18. There are a very limited number of tables available. FCC exams will be offered at 1300. For more info. call 802-879-6589.
****
NEW ENGLAND
CLUB: HOSS TRADERS EVENT: FLEA MARKET
PLACE: DEERFIELD (LIKELY PLACE) DATE: 12 May 1990 (SAT) TENTITAVE DATE
DEALER SETUP: Anytime OPEN TO PUBLIC: All night Friday & Sat.
ADMISSION: $5.00 buyers or sellers TABLE PRICES: No extra charge
TALK-IN: 146.40/147.00 or .52 direct REFRESHMENTS: LOTS

94. PL Tones Above 100 Hz Filtered?

Newsgroup: rec.ham-radio
Date: 1990-01-05 19:50:00 UTC
From: christiansen%chera1.decnet@FLOSSIE.CHE.WISC.EDU
Message-ID: <9001060802.AA04311@ucbvax.Berkeley.EDU>
Source record: 14348

A recent poster (no, I don't have the reference) indicated that
modern, well-engineered repeaters would filter out PL tones.

Is this the case for the tones above 100 Hz? It seems to me that
I read in a recent issue of _Ham Radio_ that the tones below
100 Hz were intended for _repeater_ control and those above
100 Hz were intended for _receiver_ control. Hence, the repeater
should pass or regenerate these tones.

Am I mistaken? Some new radios (IC-2SAT, etc.) have all the hooks
to make use PL as a receiver control system...

Source record: 14349

```
================================================================================

TH-75A TRANSMIT MOD
-------------------

This modification will allow the TH-75A to transmit from 136 to 167 MHz and 420
to 450 MHz. Specifications are guaranteed for the Amateur Bands only. Through
the transceiver will display 136 to 174 MHz and 335 to 512 MHz, the PLL circuit
may not lock through the entire range and it will only transmit were the PLL
locks. This varies from one radio to another. My TH75 will transmit from 136
to 174 MHz on VHF and 380 MHz to 460 MHz on UHF. If you want to change the
transmit range you could play with the VCO of which I know nothing about.

CAUTION
-------

Protect your license. Make sure that you operate on authorized frequencies
only.

MODIFICATION PROCEDURE
----------------------

1. Disconnect the battery and antenna.

2. Remove the three case screws and two battery plate screws.

3. Lift the front panel from the body of the transceiver, but do not
disconnect the two flex cables.

4. Cut the green jumper wire (W1) that is located to the left side of
the CPU in the front panel assembly if you have not already done it.
This increases your RX.

5. Above the position were the green jumper wire (W1) was you will find
two surface mounted diodes. The one you want to remove is D4 according
to the schematic diagram and will have a diode symbol painted on the pc
board. ***CAUTION**** since this diode is quite small and close to the
microprocessor you need to be extra cautious.

5. Assemble the transceiver by reversing steps 1-3.

6. Reset the CPU by holding the M key as the power is turned on.

I have tried it and it works. Standard disclaimer applies!!!!!

I see.

Well, then, it's no wonder Monsieur DeArmond has such a distaste for it --
being, as he his, against "obscenity", he no doubt sees (as does anyone who's
against "obscenity") sexual innuendo in every word.

(BTW: Can we expect a round of Standing Wave wars? Or would it just be
Antenna wars?...)

==========

SCANNER SEARCHERS GUIDE

Version 5, Compiled by N5OWK
Public Domain (p) January 1990

==========

30.000 - 46.610 MHz Business Band, Government

35.020 McDonalds Drive-Up Orders (Common)
40.500 Emergency "Guard" (NAVY)

46.610 - 47.000 MHz Portable Phones

The following channels are listed as BASE/HANDSET.

46.610/49.670 Channel 1
46.630/49.845 Channel 2
46.670/49.860 Channel 3
46.710/49.770 Channel 4
46.730/49.875 Channel 5
46.770/49.830 Channel 6 (Also Baby Monitors on 49.83)
46.830/49.890 Channel 7 (Also Baby Monitors on 49.89)
46.870/49.930 Channel 8
46.930/49.990 Channel 9
46.970/49.970 Channel 10

47.000 - 49.670 MHz Business Band
49.670 - 50.000 MHz Portable Phones
50.000 - 54.000 MHz Amateur Radio
54.000 - 72.000 MHz VHF Television (Ch 2 - 4)

Television Channels are 6 MHz wide
Video is Fo + 1.25 MHz
Audio is Video + 4.5 MHz
Color Burst is Video + 3.5795 MHz

72.000 - 76.000 MHz Model Radio Control, Aviation and Industry

75.000 MHz is Aircraft Navigation Marker Beacon. This is near
airports on the ILS (Instrument Landing System) course. Three lights
are in the cockpit (Purple, Amber, White):

Purple - Outer Marker, Intercept Point, 4 to 7 Miles downrange
Two 400 Hz Dashes Per Second.
Amber - Middle Marker, Cat I Decision Height, 3500 Feet
downrange, 1300 Hz Dot and Dashes 95 times a minute.
White - Inner Marker, Cat II Decision Height, 3000 Feet
downrange, Six 3000 Hz Dots Per Second.

76.000 - 88.000 MHz VHF Television (Ch 5 - 6)
88.000 - 108.000 MHz FM Commercial Advertising
108.000 - 112.000 MHz Aviation Navigation (Terminal VOR, ILS)

Currently 80 50 kHz Channels

112.000 - 117.950 MHz Aviation Navigation (VOR)

Currently 120 50 kHz Channels

118.000 - 136.000 MHz Aviation Communication

Currently 720 25 kHz Channels

121.500 Emergency, Emergency Locator Transmitters (ELT), "Guard"

122.700, 122.725, 122.800, 122.925,
122.975, 123.000, 123.050, 123.075 - UNICOM frequencies
122.900 - MULTICOM frequency
123.050, 123.075 - Heliports
122.750 - Air to Air Communications
122.975 - Air to Air Communications for high altitudes (airliners)
123.450 - Air to Air Communications (Trans-ocean get together, etc)
121.600 - CAP practice ELT search (under authorized missions only)
121.700, 121.800, 121.900 - Ground control frequencies.

136.000 - 138.000 MHz Weather Satellite, Government, Business
138.000 - 144.000 MHz Government (Military Bases)
144.000 - 148.000 MHz Amateur Radio
148.000 - 151.000 MHz Government, CAP, CD, MARS
151.000 - 156.250 MHz Business Band (Police, Fire)
156.250 - 157.425 MHz Marine Band

156.800 Marine Emergency "Guard"

157.450 - 160.200 MHz Business Band (Police, Fire)
160.200 - 161.600 MHz Railroad (161.600 is Marine Band)
161.605 - 161.795 MHz Business Band (Radio and TV Remotes)
161.800 - 162.000 MHz Marine Band (Telephone)
162.000 - 174.000 MHz Government, Some Business (Radio and TV Remotes)

This is the common "Government Band", frequency spacing
is typically 12.5 kHz, other users are 5 kHz spacing

NOAA Weather is transmitted on:

162.400, 162.425, 162.450, 162.475, 162.500, 162.525, 162.550

174.000 - 216.000 MHz VHF Television (Ch 7 - 13)
216.000 - 220.000 MHz Maritime Mobile
220.000 - 222.000 MHz Land Mobile Radio
222.000 - 225.000 MHz Amateur Radio
225.000 - 329.000 MHz Government
329.000 - 335.000 MHz Government (Airport Glide Slope Navigation)
335.000 - 400.000 MHz Government

364.200 AICC (Airborne Intercept Control Common)

Many security low power control devices are located in the 225 - 400
band, both civilian and government.

243.000 Emergency Primary "Guard"
282.800 Emergency Secondary "Twenty-Eight Twenty-Eight"

400.000 - 420.000 MHz Government (Base Walkie/Talkies, Pagers, etc)
420.000 - 450.000 MHz Amateur Radio
450.000 - 470.000 MHz Business Band (Police, Fire, Radio and TV Remotes)
470.000 - 890.000 MHz UHF Television (Ch 14 - 83)

(All channels not used anymore, 70 - 83 Obsolete)

806.000 - 810.000 MHz Business Band (Conventional Systems, Mobile Input)
810.000 - 816.000 MHz Public Safety (Slow Growth Systems, Mobile Input)
816.000 - 821.000 MHz Business Band (Trunked Systems, Mobile Input)
821.000 - 825.000 MHz Land Mobile Satellite Service (Mobile Input)
825.000 - 835.000 MHz Cellular Telephone Non-Wireline (Mobile Input)
835.000 - 845.000 MHz Cellular Telephone Wireline (Mobile Input)
845.000 - 850.000 MHz Cellular Telephone (Expansion, Mobile Input)
850.000 - 851.000 MHz Unallocated
851.000 - 855.000 MHz Business Band (Conventional systems, Base Output)
855.000 - 861.000 MHz Public Safety (Slow Growth Systems, Base Output)
861.000 - 866.000 MHz Business Band (Trunked Systems, Base Output)
866.000 - 870.000 MHz Land Mobile Satellite Service (Satellite Output)
870.000 - 880.000 MHz Cellular Telephone Non-Wireline (Base Output)
880.000 - 890.000 MHz Cellular Telephone Wireline (Base Output)
890.000 - 895.000 MHz Cellular Telephone (Expansion, Base Output)
895.000 - 902.000 MHz Land Mobile Radio (Mobile Input)
902.000 - 928.000 MHz Free-For-All, No use near White Sands, and Denver
928.000 - 930.000 MHz Multi-Address Paging
930.000 - 931.000 MHz Advanced Technology Paging
931.000 - 932.000 MHz Common Carrier Paging
932.000 - 935.000 MHz Government/Private Shared
935.000 - 941.000 MHz Land Mobile Radio (Base Output)
941.000 - 944.000 MHz Government/Private Shared
944.000 - 947.000 MHz Broadcast Studio To Transmitter Link
947.000 - 952.000 MHz Broadcast Radio Services
952.000 - 960.000 MHz Microwave Relay and Paging
960.000 -1240.000 MHz TACAN/DME, RADAR/IFF, Government

TACAN has 126 X and 126 Y channels. Normally only X channels
are used, unless crowded. TACAN frequencies are tied to VOR
frequencies. (Note: there are more TACAN frequencies than
VOR frequencies, some are blanked around the ATCRBS Beacon
frequencies, and others are for expansion and military use).
Pulse widths are 3.5 microseconds. Aircraft sounds like a Top
Fuel Dragster or Funny Car when searching for lock-on.

```

```

Air Traffic Control Radar Beacon System (ATCRBS - "At Crabs",
Secondary Radar - to the British)

1030 MHz Ground Interrogations to Transponder
1090 MHz Transponder Replies to Ground

There are currently five interrogation modes in use:

Mode 1, 2 pulses spaced 3 microseconds [Military]
Mode 2, 2 pulses spaced 5 microseconds [Military]
Mode 3/A, 2 pulses spaced 8 microseconds [Military/Civilian]
Mode 4, encrypted, IFF [Military]
Mode C, 2 pulses spaced 21 microseconds [Military/Civilian]

A third pulse is also included in all modes (except 4) at
2 microseconds from the first. This is the sidelobe pulse.
if it's within @6 dB of the first pulse (or greater) the
transponder doesn't reply (as it has detected an antenna
sidelobe). Pulse widths are .8 microseconds.

The reply is two framing pulses spaced 20.3 microseconds apart, with 13 code pulses (0000 - 7777 Octal) and an X pulse at the center which is not used anymore). A fourth pulse (called SPI pulse (Special Position Identifier) is used to identify your position when asked by a controller to "Squawk Ident", it is 4.35 microseconds after the last framing pulse and lasts for 20 seconds (about 2 scans of a long range radar). Pulse widths are .45 microseconds.

1575.42 MHz is the Navstar Global Positioning System (GPS) frequency L1, and 1227.6 MHz is L2.

From: alanb@hpnmdla.HP.COM
Message-ID: <1250108@hpnmdla.HP.COM>
Source record: 14353

The tower would likely IMPROVE the interference situation since it would get the source of the radiation (the antenna) up 75 feet in the air where it would be farther away from your house.

But the purpose is served even if only local OBS ops monitor regularly. They in turn get on all the local and section nets and pass the info on. It's surprisingy effective, considering it is based on 1930's technology.

=========
SpaceNews
=========

MONDAY JANUARY 8, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world. It is available for UNLIMITED distribution.

* STS-32 LAUNCH TODAY *
======================
STS-32 astronauts arrived at KSC on Friday at about 4:30 PM EST, to prepare for the 10-day mission. Launch remains scheduled for 8:10 AM EST (1310 UTC) today, which is the opening of the 54 minute launch window.

Work is continuing to prepare Atlantis for the STS-36 mission next month. Transfer of the vehicle to the VAB is planned in about two weeks.

* MUSES-A LAUNCH *
==================
ISAS News, Number 105 from December 1989 reported that the launch of MUSES-A is scheduled for 23-Jan-90 at 1150 UTC.

[From: Yoshiro Yamada of the Yokohama Science Center, Japan]

* MICROSAT LAUNCH *
===================
The SPOT-2/MicroSat/UoSAT spacecraft launch is scheduled for 11-Jan-90 at 01:35:25 UTC. The AMSAT Launch Information Network System (ALINS) will be on the air to cover this launch LIVE from French Guiana, South America. The net is scheduled to run from 01:00 to 02:30 UTC on 11-Jan-90.

The following stations are part of the ALINS network:

W1AW : ARRL - Newington, CT. - Beaming Europe
1.890, 3.990, 7.290, 14.290, 21.390, 28.590, 50.190, 147.555 MHz

WA3NAN: Goddard Space Flight Center - Greenbelt, MD. - Beaming USA
3.860, 7.185, 14.295 MHz

W5RRR : Johnson SFC - Houston, TX - Beaming Central and South America
3.840, 14.280 MHz

W6VIO : Jet Propulsion Lab - Pasadena, CA.
3.850, 21.280 MHz

There will also be transmissions from South Africa on:
3.718, 7.080, 14.282 MHz SSB and 3.665 & 7.094 MHz AM

Listen on these frequencies to follow this historic Amateur Satellite launch! Launch coverage may be also found on selected FM repeaters carrying ALINS audio.

* MICROSAT TRACKING *
==========
The following N4HY Keplerian element will help in tracking the MicroSats:

Epoch : 90 011.0816319
Incl : 98.738
RAAN : 87.11413
Eccn : 1.34E-03
ArgPer : 110.95
MeanAn : 297.18
MeanMo : 14.1988896
Drag : 1.0E-06
Rev# : 0

Should a launch delay occur, add 0.98561226 degrees to the RAAN for each day the launch is delayed (ex: 0.0020833 degrees = 3 minutes). Launches on different days should occur around the same time of day (01:35 UTC).

This element set will remain valid for about a week, since all seven MicroSats will remain in close vicinity to one another for some time. After several weeks, they will drift apart and require separate element sets for accurate tracking.

* MICROSAT MONITORING *
==========
The first signals from these new satellites may be heard shortly after deployment on the following frequencies. Note that each OSCAR is named in order of deployment:

Spacecraft Name	Frequency	Telemetry Format
UoSAT-D (UO-14)	435.070 MHz	9600 bps AFSK AX.25
UoSAT-E (UO-15)	435.120 MHz	9600 bps AFSK AX.25
PACSAT (PO-16)	437.025 MHz	1200 bps PSK AX.25
DOVE (DO-17)	145.825 MHz	1200 bps AFSK AX.25
WEBERSAT (WO-18)	437.075 MHz	1200 bps PSK AX.25
LU-SAT (LO-19)	437.150 MHz	1200 bps PSK AX.25
LU-SAT (LO-19)	437.125 MHz	12 WPM Morse Code

In addition to the frequencies listed, PACSAT may also transmit on 437.050 MHz and WEBERSAT on 437.100 MHz.

The downlink signals from DOVE require only a 2-meter FM receiver, antenna and unmodified Packet Radio TNC-2 for reception. The other spacecraft require SSB receivers and PSK demodulators (such as TAPR, G3RUH) in addition to a basic terminal node controller and computer.

Downlink signals should be sufficiently strong to be heard using "J-pole" antennas rather than directional yagis. Thus, "auto-tracking" will not be required for stations wishing to have unattended PACSAT operation, for example.

* GALILEO MISSION STATUS *
==========
January 3, 1990

Today the Galileo spacecraft is 13.6 million miles from Earth. Round-trip light time is almost 2+ minutes. It has travelled 116.4 million of the 185 million miles in its path to Venus encounter, now about 5 weeks away. Heliocentric velocity has risen to 71,020 mph. The spacecraft's spin rate is 3.14 rpm as estimated by the star scanner, and the attitude sun point angle is at 0.5 degrees.

Last week's four-day science checkout was generally successful. All orbiter instruments were exercised and tested; the magnetometer, the heavy ion counter, the dust detector, and the UV spectrometer are still powered. On December 22, Galileo conducted a successful second trajectory correction maneuver, as programmed and monitored by the flight team.

At present the mission is proceeding as planned with the spacecraft in normal dual-spin cruise mode. All temperatures and pressures are within acceptable limits, and the downlink telemetry rate is 1200 bits per second.

DC and AC voltage imbalance measurements continue to fluctuate. All other power related measurements are stable and are as expected.

On January 8, the operational sequence EV-4 (fourth sequence in Earth-Venus cruise) concludes, and EV-5 begins. EV-6 will contain the Venus flyby operations.

[Story by Ron Baalke, Jet Propulsion Lab, Pasadena, California]

**** UoSAT-OSCAR-11 BULLETIN - 208 04 January 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

H A P P Y N E W Y E A R FROM ALL AT UoSAT

** UoSAT-D & E WAITING FOR LAUNCH ON ARIANE V-35 **

The UoSAT-D and UoSAT-E spacecraft are now mounted on the top of the ARIANE-40 rocket at the Guiana Space Centre and are waiting for launch due on 11 January at 01:34 GMT - along with SPOT-2 and four AMSAT Microsats. The on-board batteries for each of the six microsatellites are being trickle-charged via umbilical lines to the launch pad. Martin Sweeting (G3YJO) will travel from UoS to Kourou to join 'Max' Meerman (G7DQE) for the launch. Launch nets will be established on the following amateur radio frequencies, commencing at 01:00 GMT:

AMSAT-UK: 3.780 MHz
WA3NAN: 3.860, 7.185, 14.295 MHz
AMSAT-SA: 3.718, 7.080, 14.282 MHz
AO-13: 145.950, 435.970 MHz

Following a successful launch and separation from the rocket, UoSAT-D & E will be activated for the first time around 09:20 GMT when in range of the UoS

Mission Control Groundstation at Surrey. It is intended that the spacecraft will transmit 1200 bps AFSK fixed-format telemetry for the first active orbit with the 435 MHz downlinks switching on/off every 60 seconds under the control of the secondary (Z80) OBC. If all goes well, the FORTH DIARY will be loaded into the primary (RCA 1802) OBC on the following orbit producing telemetry (FORTH format), Bulletins and WOD - all at 1200 bps AFSK. It is planned to fire the tip-mass pyros and release the magnetometer boom on the next day before commencing attitude manoeuvres.

UoSAT-D/E Telemetry formats and calibration equations will be published shortly.

Provisional Orbital Elements for SPOT-2, UO-D & E, Microsat-A,B,C,D:

Catalog numbers: not yet assigned
Epoch time: 90011.0816319
Element set: pre-launch
Inclination: 98.738 deg
RA of node: 87.11413 deg
Eccentricity: 0.00134
Arg of periwee: 110.95 deg
Meananomaly: 297.18 deg
Mean motion 14.1988896 rev/day
Decay rate: 1.0e-06 rev/day^2
Epoch rev: 0

The following are the Microsat and UoSAT listening frequencies and modes listed in order of deployment. The OSCAR numbers listed are, of course, tentative and assume a successful launch on schedule.

Spacecraft OSCAR number Frequency Mode

UoSAT-D UO-14 435.070 1200/9600 bps AFSK Tlm & AX.25
UoSAT-E UO-15 435.120 1200/1200 bps AFSK Tlm & AX.25
PACSAT PO-16 437.025 1200 bps PSK AX.25
DOVE DO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT WO-18 437.075 1200 bps PSK AX.25
LUSAT LO-19 437.150 1200 bps PSK AX.25
LUSAT LO-19 437.125 12 WPM CW telemetry

** AO-13 OPERATING SCHEDULE **

The following information is provided by AMSAT-DL.

MODE B MA 000 TO MA 110
MODE JL MA 110 TO MA 145
OFF MA 145 TO MA 150 BAHN LAT +3.6 deg
S BEACON MA 146 TO MA 147 BAHN LON 179.4 deg
MODE S MA 147 TO MA 160
MODE B MA 150 TO MA 255
OMNI ANT MA 225 TO MA 035

AMSAT OSCAR-10 is currently available for whole orbit operation via the mode B transponder.

Hi,

I am despirately (well not really that badly) trying to locate a company called Microwave Modules that makes transverters. If not them direct, any companies that resell their stuff. I have had several responses to an earlier query about transverters pointing towards them, but I have been unsuccessful in tracking them down.

Any help would be *GREATLY* appreciated!

Please email responses. Thanks in advance!

Mark.

109. Shortwave commercial radio

Newsgroup: rec.ham-radio
Date: 1990-01-06 20:15:27 UTC
From: remaker@pepsi.amd.com
Message-ID: <28653@amdcad.AMD.COM>
Source record: 14363

Forgive me if this is an inappropriate post, but I figure this audience is best suited to answer this question:

I got a letter from a friend who is spending a year in Japan and lamented that the radio stations were pitiful, presenting a hodgepodge of news, classical, and traditional Japanese music. I also understand that there is a large market for tapes of broadcasts from American radio stations, and yet there are no signs of improvement in the FM market.

My question is: On the shortwave worldwide bands, does any country broadcast something like an American "classic rock" broadcast (which can be received in Japan)? If no such station exists, what are the obstacles and implications of getting licensed to start one? I know that a lot of college radio stations are pushed off the air because they cannot get an American FM license, and I would bet that some college radio station would love to take to the airwaves internationally (the quality would probably be better than carrier current!)

Also, what are the implications of licensing a commercial station to rebroadcast its signal over shortwave? If WFNX in boston did this, I'd buy a shortwave radio tomorrow!!!!!

110. Re: Interception of E-Mail by spies

Newsgroup: rec.ham-radio
Date: 1990-01-06 22:33:16 UTC
From: gnu@hoptoad.uucp
Message-ID: <9523@hoptoad.uucp>
Source record: 14364
Cross-posted to: sci.crypt,misc.legal,rec.ham-radio

I believe that NSA is monitoring the Internet. They certainly have the right (and duty) to monitor traffic on any part of the net that's run by the Federal Government.

And I find it curious how the official policy of the Internet is "no thru traffic for other nets" but the benevolent administrators kindly turn their backs, spend the money, and bear major amounts of traffic. Surely that couldn't be because in the process they legally get to examine it?

Let's say you were head of NSA, responsible for communications security for the Feds, and Congress called you in to ask how some college student could bring the major Federal research network to its knees. "Oh, we never look at that network. Though we tap all the telegraph lines in and out of the country, and monitored private phone calls between U.S. citizens in the U.S. and other U.S. citizens in Central America under Nixon, we never bother with high speed, technically advanced government research networks." More likely they are getting a copy of every packet, but due to spook mentality they are not men enough to admit it. The Internet administrators prattle about "ethics", e.g. RFC 1087: "unethical and unacceptable any activity which purposely...compromises the privacy of users" while secretly compromising that privacy themselves.

It is probably a coincidence that the main uucp gateway for European traffic, "seismo", was run by the Center for Seismic Studies, a spook-funded organization that tracks nuclear explosions around the world. (And you thought they were studying earthquakes!) Though supposedly the costs of running the gateway were paid by subscriptions among the Europeans, I'm sure that major costs were picked up by the Center (administration, CPU time, disk space, ...).

It is probably also a coincidence that its replacement, "uunet", sat on the same machine room floor (in "donated" space) for a year. But while no other organizations were able to get Internet approval to forward other nets' traffic to-and-from the Internet, uunet somehow is "provisionally" authorized to do so!

I tried bringing this topic up on comp.protocols.tcp-ip but was censored by the moderator, who claimed I had no proof. As if the rest of the messages on tcp-ip were not full of conjectures!

I'd like to thank all those who responded to my orignal posting requesting
sources for a list of Assigned Radio Frequencies in the Los Angeles Area.
Several people responded and below are their recommendations.

From smcnet!lawrence@CS.UCLA.EDU Tue Jan 2 19:17:24 1990

Congrats on the new scanner. I have had one for a few years now and
it is kind of nice to see exactly what LAPD is doing in their helecopter that
is hovering over my house. You can either get a bright orange book from
Radio Shack (published by Hollins Radio Data. not R.S.) that has listings
for all the fire, police, most of the large hospitals and some businesses or
there are also a couple of other books that you can pick up at ham radio
stores. I have seen a few at Henry Radio (Bundy Blvd. just above Olympic
in West L.A.). Many of the books do not include some of the more
interesting listings. The Radio Shack book does have a table in the back
that lists the FCC frequency allocations. This will tell you what type of
people might be talking on what freq.

A couple of the more interesting freqs are between 450.00 MHz and 451.00 MHz.
Here you will find most of the television news crews and some radio crews.
It is particulary interesting to tune in just before they do a "live remote"
from some location. You can hear the director and transmission operations
talk to the reporter and truck personnel.

Channel 2 450.5125
4 450.5625
5 450.2500
450.3500
7 450.1375
450.3125
11 450.5875
450.9500 IFB studio audio
KFWB NewsRadio 450.8500

From skipsand%pnet01%crash%trout.nosc.mil%nosc%ncr-sd%scubed.uucp%ll-xn.uucp@usc.edu Tue
Jan 2 23:14:51 1990

You can download a list (called CPRA.ARC) on my BBS (The Central Intelligence
Agency) at 619-273-6339, online weekdays Midnight to 5pm, randomly evenings
and weekends when I'm not using the computer. (Best eves are before 8pm,
weekends best before 10am). The CPRA list is the list generated by the
APCO Coordinators for all Southern Cal/West AZ/SW NV of public safety
users.

From ron@hpfcso.hp.com Wed Jan 3 08:42:30 1990

Radio Shack sells one version of a frequency listing.
Fox Radio prints another which is usually more specifically targeted
for certain cities.
Bearcat publishes another.

Since RS is the most available, I'd recommend you start with that.
Then start reading scanner and radio mags for other sources.

You could also begin your adventure by programming a frequency range
and then loggin the channels and trying to figure out who (or what)
they are. This is pretty challenging but also lots of fun.

From doug@hokulea.soest.hawaii.edu Wed Jan 3 08:56:10 1990

Try Radio Shack. They carry a scanner book, called Police Call (I believe)
that covers scanner freq. for CA, OR, WA areas. The frequencies are broken
down by state and county. While this is not an exaustive list, it is a good
place to start.

From jincai@muskat.usc.edu Wed Jan 3 18:04:53 1990

I bought a scanner last summer, and most frequencies I'm listening to
are from "Police Call" sought at Radio Shack. You have to do some
screening work since there are too many listings in that book. If you
already have this book, Cilff (a veteran scanner at USC) pointed me
another place to get frequnecy listing. The place is located at 2050
S Buddy Ave. (Herry's Radio), you may take a look at it then give me
your impression since I've never found time making the trip.

From portal!atari!mn@uunet.UU.NET Wed Jan 3 22:16:19 1990

Look around for a book called Government Radio Systems. It's a big phone
book sized book and there's a Calif edition. One of the most complete
scanner freq books I've seen, and very current.
I was in LA just a few weeks ago and remember seing it at some ham radio
store. It's not cheap at $29.95 but if you had to only have one scanner
freq book this is the one to get!

From denwa!bongou Wed Jan 3 23:14:00 1990

There is a book called "FOX Scanner Radio Listings - Los Angeles
Area". There is also another book available. Radio Shack also
carries frequency lists for your area.

You can get scanner books etc at Jun's Electronics in Culver
City. There is a Scanner Club in LA and they have details.

From pacbell!acsdev!bobm@ames.arc.nasa.gov Thu Jan 4 03:10:56 1990

I recently picked up a book covering the entire state of California,
listing all (government type) frequency usage by county and city.
It is called Government Radio Systems.
This book should be available from:

Communications Center or Jun's Electronics
916 North Euclid 3919 Sepulveda Blvd
Anaheim Culver City

At least, that is listed in the book as a dealer who carries this
book. You can purchase it directly for (sit down)... $27.50
from :

Mobile Radio Resources
2661 Carol Drive
San Jose, CA 95125
(408) 292-4342

For a local list, check out your local radio dealer. I hear
that Radio Shack will sometimes have a book available for
local frequencies, but I would check with independent type
places first. The local dealer here (The Base Station) in
Concord publishes their own book compiled from customers and
the store owners. This book is great if you live in Contra
Costa County. Anyway, Government Radio Systems is highly
recommended. Please note, however, that this book lists only
state, county, and local government usage along with sheriff,
municipal police, fire, and ambulance. For other stuff like
aircraft, railroads, transit systems, etc. you will have to
check with a dealer or maybe even a local club.

Thanks again everybody!

Quite a trick, considering that comp.protocols.tcp-ip isn't moderated.

Greenpeace Radio has an Alden model 519 facsimile recorder which has become surplus to our needs. This machine prints weather maps (both HF and APT) and press photos on 19" wide paper. Pilots will recognize this machine as the one used in flight service stations to produce aviation weather maps. It is built to the highest standards and was in good operating condition when removed from service a few years ago. The model 519 operates at 60, 90 (Russian) and 120 RPM and at 96 and 48 lines per inch, enabling it to copy virtually anything on the air. This unit is complete with a model 421A facsimile converter which will accept a fax signal directly from the audio output of your receiver. Several rolls of paper (still available from Alden) and the service manual are included.

This machine is available free to any person or organization that will put it to good use. It is large and heavy (about the size of a large dresser) so shipping is not possible. If you can give this machine a good home, contact Dick Dillman,

Greenpeace Radio, Building E Fort Mason, San Francisco, CA 94123
or call (415) 474-6767.

114. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-01-07 02:34:34 UTC

Message-ID: <9001070801.AA18374@ucbvax.Berkeley.EDU>
Source record: 14368

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

115. Re: PL Tones Above 100 Hz Filtered?

Newsgroup: rec.ham-radio
Date: 1990-01-07 05:48:54 UTC
From: brian@ucsd.Edu
Message-ID: <10862@ucsd.Edu>
Source record: 14369

Few commercial repeaters are equipped with PL tone couplers; most regenerate the tone in conjunction with the decoding process. The audio path between receiver and transmitter is pretty sharply high-passed starting at about 250 Hz or so.

The repeaters we used to build were an exception to this. To save on encoders, we installed tone couplers which were a bandpassed amplifier designed to pass the PL tone around the audio circuitry. By doing that, we got much faster response (didn't have to wait for the hilltop encoder to start) but our repeaters rumbled a bit during the delayed-dropoff time.

Commercially, there's no distinction between tone usages. Perhaps in some areas the hams are doing that but it's sure not a nationwide thing unless some Japanese manufacturer starts selling radios equipped that way.

Try out KUSW in Salt Lake City or WRNO in New Orleans. Both are certainly well heard on east cost US and probably so in Japan. R. Luxembourg on 6090 KHz around midnight gmt is heard so-so here, but probably not in Japan. Try in the upper 19 mb (about 15.4 & ^ MHz). They seem to jump frequency a good bit, and I don't have a schedule for either of them. I think KUSW deliberately tries to get lots of international listeners.

This discussion probably should be moved to rec.radio.shortwave.

I know some hams who use or have used the Butternut HF-2V 80/40m vertical with great success. Some have used it in the ground-mounted fashion and some have elevated it 5-10 above the ground. Your best bet would be to elevate the vertical a few feet from the roof and use 8 counterpoise radials (4 for 40m and 4 for 80m). Assuming you have no severe local QRN sources the installation should perform quite well. You will be surprised what you'll be able to work.

The West Coast should be easy to work. The Midwest will be fairly easy. The East Coast will be tough....if there is a grayline path you should be able to work a number of East Coast stations. The grayline path is usually much easier to work due to the lack of absorption and the fact that much of the path is over water. I'm not sure how you'll do into Europe but with persistence and some sort of reasonably efficient antenna system you should be able to work the serious European DXers anyway.

Good luck......I could use XX9 on 80m, already have it on 40m..

118. Re: Crossband repeater mod for TM-701a?

Newsgroup: rec.ham-radio
Date: 1990-01-07 17:51:05 UTC
From: km3t@jjmhome.UUCP
Message-ID: <5113@jjmhome.UUCP>
Source record: 14372

In article <9001041448.AA00497@nips.ssesco.com>, elmquist@NIPS.SSESCO.COM writes:
> I don't see a mod on HAMSTER for enabling the crossband repeater
> action on the new Kenwood TM-701a 2m/70cm rig. Does anyone
> know how to do this? and how to turn it on once the mod is performed HI!

I can't remember exacctly where I got this and I haven't tried it yet on my TM-701A but I know I've seen the extended frequency mod somewhere else and know people who've performed it successfully. PROCEED AT YOUR OWN RISK.

TM-701A REPEATER CROSS-BAND MODIFICATION (REVISED)

This Mod is from KENWOOD

Perform The following modification to allow the TM-701A to operate in the repeater cross-band mose.

MODIFICATION:

1. Disconnect the power supply and antenna.

2. Remove the top and bottom covers (12 screws). Disconnect the speaker wire from the transceiver.

3. Locate the green jumper wire shown in figure 1. Using a sharp pair of wire cutters, cut the jumper in half.

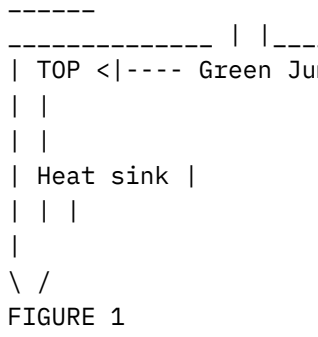

FIGURE 1

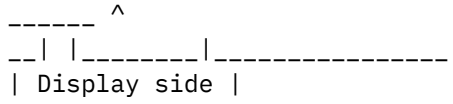
CAUTION: Cutting the green jumper allows the TM-701A to transmit from 142 to 151.995 MHz. Protect your license by only using frequencies that you are authorized to transmit on.

4. Solder a jumper wire to the foil side of the TX-RX board as shown in Figure 2.



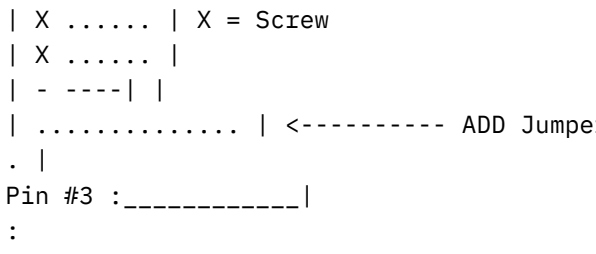


FIGURE 2

5. Assemble the transceiver by reversing steps 1-2.

6. Reset the microprocessor by holding in the MR key as the power is turned on.

The repeater cross-band operation allows the TM-701A to receive on one band and re-transmit the signal on the other band. The TM-701A alternately displays the two bands until a signal is received. The transceiver will then display the band that is re-transmitting the signal. The shift function cannot be used during the repeater cross-band operation. If the TONE or CTCSS function is required, only one EIA tone can be used for the two bands.

OPERATING PROCEDURE:

1. Select the operating frequencies for both bands.

2. Set the squelch control to the threshold point. The TM-701A will transmit in the repeater cross-band mode if the squelch control is set too low or a signal is received.

3. Place the transceiver in the duplex mode (F + DUP).

4. Press the F key for longer than one second. The F indicator will flash.

5. Press the LOW key. The transceiver will now enter the repeater cross-band mode of operation.

6. To cancel the operation and return to the VFO mode, press the VFO key.

Michael Bachelor speculated that probably very few people listen to
the W1AW bulletin transmissions.

I feed ARRL bulletins into the packet network from Seattle. The only
way to get them is to pick them up off of HF on Baudot, ASCII or AMTOR
and then format them for packet. I have a C64 and an AT clone sitting
here while I am at work, copying this stuff. When I get home I feed
the network with any new material.

> ICOM.
> --
> Douglas L. Datwyler WR7O

Sorry, the above is completely wrong. I asked Kenwood about this
and they said their DSP is *not* an audio filter and it is *not*
direct digital synthesis. It actually works at IF frequencies
to generate and detect SSB signals. Notice, when I said IF frequencies,
I didn't say 8 MHz. or even 455 kHz. It is a very low 4th IF frequency
at which DSP is practical. But it is not baseband (audio). Otherwise,
it wouldn't affect opposite sideband rejection, which Kenwood says
it does. The IF bandwidth of the analog filters in the 950 is 6 kHz.
and the DSP then sharpens this up as desired.

I specifically asked them about whether the 950 uses DDS, and they
said no, but their synthesizer scheme was claimed to be much better
than older designs like the 940, and "just as good" as DDS. Now
that may be a marketing ploy. But I haven't seen the numbers to
compare with Icom's DDS.

BTW, you can make the LO in your receiver as clean as you want, but
you will still be limited by the LO in the interfering transmitter.
Unless that happens to be DDS controlled, you are wasting your
money putting a DDS synthesizer in your receiver.

Along the lines of a FM station that broadcasts in Shortwave too....

There is a station (100.3 - KPWZ (?) "Pirate Radio") that claims to broadcast on some satellite (it escapes me right now) channels 5 and 6. It even has an 800 number to call in to the station (800-742-2100) from all over the US. On Saturday nights, they intertain callers from all over the country (including Alaska). Maybe people in other countries can listen in on this too? (But I doubt they can call the 800 from another country).

> antenna, the signal won't go as far: 1 w on 144 will go further than
> 1 w on 440 assuming everything else being equal).

The equality is not even possible to achieve. Suppose you are measuring the signal strength using halfwave dipole antennas on transmit and receive. Because of the resonance at the chosen frequency, the receive aperture is very different.

Is it "equal" for the distance to be the same in meters or to be the same in wavelengths?

Given a constant aperture for transmit and receive expressed in meters, and a constant power, you can get further with the higher frequency because of the extra transmit and receive gain you get.

Then there is "equal" in terms of dollars, which changes things around quite a lot. :-)

125. TM-721A mods - posting

Newsgroup: rec.ham-radio
Date: 1990-01-08 06:48:08 UTC
From: erc@khijol.UUCP
Message-ID: <920@khijol.UUCP>
Source record: 14379

I received a response to my request for 721 mods, but instead of
suggesting that the mods be posted, so they could do everyone
some good, I requested that they be emailed to me. How selfish
of me. I apologize, and to do penance for my misdeed, have added
a section on how to retune the PLL for lock above 460 MHz, and have
also corrected a couple of spelling errors. Have fun!

P.S. Thanks to Frank Abbott at the University of Texas for
downloading these from HAMSTER.

721.mods:

Here are the changes I have made for the 721 mods. They involve
instructions for retuning the PLL for 460 MHz reception. I have
not tested PLL lock for out-of-band transmission (for obvious
reasons), but the PLL should lock over the receive range.

I have also corrected a couple of spelling errors.

Subject: TM721 modification
Cc: ve3pzr@uwo.ca

The TM721 modification is very EASY. Here is the information :

Chip resistor R121 on the Control Unit must be removed. Here is how.

1. Disconnect power and antenna
2. Remove the top and bottom covers (12 screws)
3. Remove the silver coloured screws from the front panel chassis.
(2 on each side, 1 on top, 1 on bottom)
4. Pull front panel away from the radio but DO NOT disconnect cables.
5. Locate chip resistor R121 on the Control Unit and desolder.
When looking at the Control Unit, you will see the lithium battery
located to the left of centre and the power switch sub-assembly
located on the bottom right. Look at the centre of the lithium battery
and you will see R121 located down and to the left of the battery
close to the bottom edge of the board about 3/4" left of centre of
the battery. Remove this chip resistor.

6. There is also a 3 minute time-out timer that will place the radio
into the receive mode after 3 minutes of continuous transmit. I
removed mine and I will describe the location of R122 which defeats
the timer. If you look again at the lithium battery, look at the
bottom edge of the battery and then over to the right about 1 inch

from the bottom centre of the battery and you will come across an upper set of 2 resistors and below that another set of 5 resistors (chip type). Remove the first resistor (left one) in the upper set.

OPERATION

Repeater cross-band operation allows the 721 to receive on one band and retransmit the signal on the other band. An incoming signal will automatically be switched to the subband. The 721 will then re transmit the signal from the main band. Each band may contain offset and subaudible tone information with the tsu-6 tone board.
The encode and decode tones for a single band must be the same. Each band may contain a separate sub-audible tone frequency.

1. Select the first frequency in the main band and select a repeater offset if desired.
2. Select TONE if needed.
3. Press the BAND key to transfer contents of MAIN into SUB.
4. Select the second frequency and if desired a CTCSS tone.
5. Adjust the main and sub band squelches to the threshold.

ENABLING CROSS BAND REPEATER

1. Press the F (orange function) key
2. Press the A.B.C. key within 5 seconds of step 1
Three dots will light in the decimal place locations in the MAIN band.

The repeater will always transmit out of the main band. I will give you an example of accessing a 70cm repeater with a 2m handheld on a simplex freq.
Desired repeater RX 444.8 TX 449.8 2m 145.54

In main band enter 145.54 and press BAND key to transfer to sub display.
Enter 444.8 with + offset. Press F + A.B.C.

Key up simplex handheld and you will see the sub-band receive your frequency and at the same time you will see the main band key up and transmit on 449.8 Mhz.

Release the simplex PTT on the handheld and the radio will quickly flip 145.54 into the MAIN band and 444.8 into the sub-band. The 70cm repeater will be transmitting to your radio in the sub-band at 444.8 and the 721 will be transmitting out of the MAIN band on 154.54.

Neat stuff !!!! Warning, disconnect your mic or be quiet and DOUBLE WARNING DO NOT PUT A 2M repeater in the MAIN and a 70CM in the sub or they will continually key up each other back and forth through the 721. Also note that when the 721 is transmitting on the MAIN band out to your 2M simplex radio and receiving a signal from the 70cm repeater, you will not be able to gain control of the transmitter of your 721 until the 70 cm tail drops as the radio does not sample the incoming audio for a carrier while transmitting.

The mod is neat and if you disable the tail timer on your 70 cm repeater, this works great in situations where a hand held (1 watt) cannot access the 2M

repeater.

Enjoy and RSVP with any further questions or concerns.
****

From: flloyd%crank@Sun.COM (Fred Lloyd)
Newsgroups: rec.ham-radio
Subject: Re: Kenwood TM-621,721 mods ?
Date: 25 Apr 89 21:43:28 GMT
Reply-To: flloyd@sun.UUCP (Fred Lloyd)

>As I was doing the cross-band repeater mod (you
>might consider it a simplex range extender) it seems
>that there are several other 0 ohm surface mount
>resistors (shorts) grounding several other pins
>on the microprocessor. Does anyone know what other
>undocumented features these units have?

The programming resistors do the following:

1. Select the European frequency bands (430 - 440)
2. Select MARS/CAP xmit freqs (141 - 150)
3. Select unrestricted out-of-band xmit (add a jumper)
4. Select cross-band repeater mod
5. Disable built-in 3 minute timeout timer for crossband repeater.

Number 1 was easy, I just installed a jumper where there were a pair
of empty pads next to a row of four or five other 0 ohm (jumper) "resistors".
I found this quite useless and promptly removed it.

Number 2 is also very easy, but unnecessary for 90% of us. If you need
MARS/CAP then you'll be able to get the details from Kenwood.

Number 3 is somewhat of a mystery as I've been told the jumper position
but have been unable to find it on the board. My interest was in
opening up the UHF receive to hear the public service channels.
Unfortuneatly, this mod opens up transmit as well, on both bands and
apparently without restriction (as the gossip goes).

Number 4 is real easy and involves removing the resistor marked R121 on the
schematic.

Number 5 is also easy and just remove R122 to do it. (I haven't though)

What I'd like to know concerns the remote control capabilities that are
available through the microphone plug. From looking at the manual,
it's clear that when the RC-10 remote control handset is used, many of
the radio's front panel controls are made remotely available. Does
anybody know the manner in which the three data pins on the mike plug
are used for this. The three pins are PTT, UP and DOWN (in normal
mode). Presumably, there is a way to communicate with the onboard
microprocessor using these pins. If so, then somebody could
concievably use their PC to control the radio.

Inquiring minds want to know....

Any Ideas?

Subject: TM-721A UHF Extend Mod

Modifying the Kenwood TM-721A for Extended UHF Coverage

Well I finally uncovered the specifics of the mod which will extend the UHF coverage of the TM-721A. This mod changes the UHF receive from it's factory setting of 438 - 449.995 mhz to approximately 420-460 MHZ. There are some peculiarities surrounding this mod so I'll describe them first.

First of all, this mod will allow the UHF digital display to traverse from 400.000 to 499.995. The radio will not, however, tune this entire range due to a combination of a limited synthesizer lock range and the input RF amplifier bandwidth. The apparent useful tuning range is about 420-460, with sensitivity dropping off sharply at either end. Naturally, the best performance is in the middle (the Ham Band :-).

Similarly, the VHF tuning range is extended in the same manner. After the mod is made, the VHF side will apparently tune from between 100-199 mhz but as stated above, there is little or no response outside of the published range (138-170 mhz), due to the same reasons as stated above.

As a final side effect, note that performing this mod will remove all out-of-band transmit restrictions on the rig, for both VHF and UHF. After the mod is in place, the radio will transmit on any frequency that it can tune to.

DISCLAIMER:

The author of this report wishes to strongly remind those who perform this mod that it is ILLEGAL to transmit on any frequencies outside of the ham bands, EVEN IF YOU ARE OTHERWISE LICENSED TO DO SO. This is because of the radio's lack of FCC type acceptance for these frequencies. So beware! Unauthorized use of this feature could be hazardous to your ticket. MARS/CAP users are probably OK with a permit.

Now for the nuts and bolts.....

MODIFICATION PROCEDURE

1. Turn the radio on and write down all of your memory channel frequency assignments, PL codes and anything else you have in memory - It will all have to be reprogrammed after the mod. After writing down all of your data, turn off the unit and disconnect it from the antenna and power supply.

2. Next, remove the bottom cover on the unit. Note: this radio contains a number of CMOS parts which could be damaged by static discharge. Take all of the regular precautions to make sure that you and your tools are properly grounded for anti-static work. Note that there is a hole in the rear of the subchassis which supports the controller circuit board in which you can see a small, black, 1/4 watt resistor which is labeled on the board as R57. Using a small pair of sharp cutters, clip the lead on the end of the resistor. It is not necessary to remove the part, just clip one end and bend it slightly out of the way.

2. Next, remove the top cover and then open the front panel assembly into the service position. To do this, remove the four silver screws, one on the top, one on the bottom, and one from each side. Two of the screws are in slotted holes. Loosen the screws in the slotted holes slightly so as to allow the front panel to be pulled out and swung down in a hinge-like fashion. Once open, set the radio on a table with the hinged front panel hanging over the edge of your workbench. Familiarize yourself with the inside of this compartment. The most notable features are a silver, button type lithium battery to the left of center and a large, multi-pin microprocessor chip on the right. DO NOT DISCONNECT ANY OF THE RIBBON CABLES.

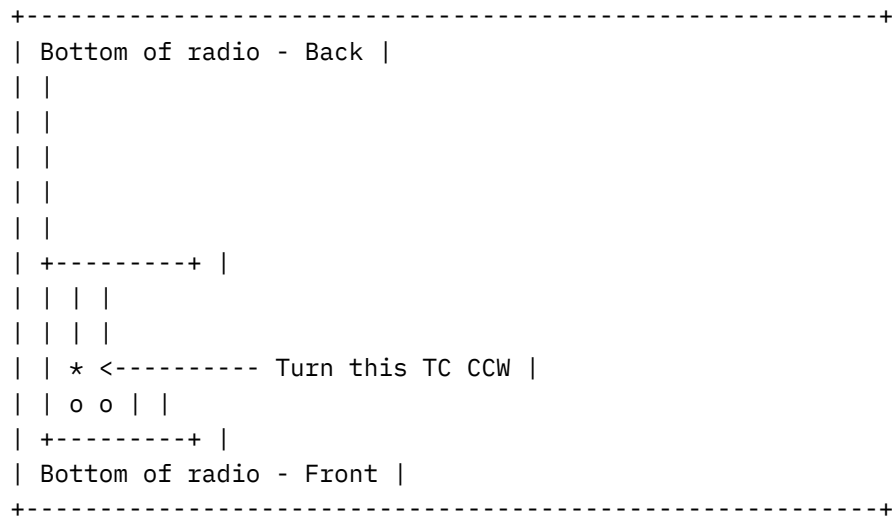
3. Locate the lithium battery and to it's left you will notice a row of five programming resistor positions, with the middle position vacant. The arrangement looks something like this:

```
|
| ____ ______
| I I:II (Bat-) |MPU |
| (tery) | |
| ---- ------
|
| I <- R121 (remove for cross-band repeater operation)
-----------------------------------------------
```

VVV front of rig VVV

The (:) above indicates where a jumper is to be placed. Use care in soldering since everything is quite small.

[This section added by Ed Carp, N7EKG. Do this ONLY if you need the PLL to lock above 460 MHz.]



3a. Look at the bottom of the radio. On the left-hand side, in the lower corner of the PCB, there is a silver can (as indicated). Place a small, non-metallic screwdriver in the hole indicated and turn the cap SLIGHTLY counter clock-wise. This will lock the VCO in the 460 MHz range (and maybe a little bit farther).

If you turn the screw farther than necessary to achieve PLL lock, the receiver or transmitter might not lock up at the band edges.

4. Reassemble the unit in the reverse order as described above. When you power the rig up, the display should show 440.000 and 144.000 on the displays. It is now ready for operation. If necessary, perform the microprocessor reset function by holding down the F button while turning on the power. Reprogram the unit with the data you saved in step 1.

Comments:

There is nothing special about operating the rig once the modification is made. All functions operate exactly as before except that the range on each band is extended as described above. You will probably want to program the band scan limiting channels (A and B) on both bands since otherwise your vfo scanning will be too broad and will spend a lot of time scanning in areas which it cannot receive.

In addition, my rig also has the cross-band repeater mod. I do not know if having this is a prerequisite to performing the mod mentioned above. If it is, then R121 will also have to be removed. The cross-band repeater mod has already been discussed on the net so I won't go into it at this time.

Enjoy this mod but don't endanger your license! Don't transmit out of band and don't allow others to, even if they're licensed for those frequencies!

Its worth noting that before it was sold to the Christian Science Monitor (and was rechristened KHBI), KYOI in Saipan (Norther Marianas) broadcast good ol' American rock-and-roll beamed towards Japan for about 16 to 20 hours per day. I have absolutey no idea how KYOI fared as a business enterprise, but this would be a *VERY* interesting question to investigate.

One reason why college/university stations might shy away from brodcasting on shortwave (from the U.S., that is) is that (to the best of my knowledge) the FCC requires commercial stations on SW to run a *minimum* of 50 kW. Buying a transmitter with at least that much power (not to mention an antenny system that can handle it) might be a bit of a finanical burden for stations used to running 3 kW or so on FM.

It *does* sound like a nice idea, though ...

A large portion of the Internet is the NSFnet. It is run funded by
the NSF, but run (on contract) by Merit (which is under the control of
the Univ. of Mich. and therefor the state of Michigan.)

Does this give the Federal Government, or the State of Michigan, or
both "the right (and duty) to monitor traffic" on NSFnet? Does "monitor"
include reading the contents of the packets - or just looking at
headers?

3rd Annual Winter Listener Festival

3rd ANNUAWINTER SWL FESTIVAL
February 23-25 1990
Holiday Inn
Sumneytown Pike
Kulpsville, Pennsylvania

The Winter SWL Festival is a good excuse for the folks with a common interest in the Shortwave Listening hobby to gather for a weekend of socializing and meeting other SWL's. Forums d roundtable discussions will be held on Saturday for those wishinto learn more about SWing or to exchange tips and techniques. Door prizes, station freebies, displays from clubs, and a banquet round outhe weekend events.

Fom topics:

Basic Propagation for the BeginnerQSL Preservation and the CPRV
Antennas for the Beginner and Advanced Listener
Shortwaveccessories
What are Utilities and where to start?
DXing Helps - Books, Magazines, Clubs, Newsletters, Atlases
The Collecting and Display of Station Memorabilia
The NASWA Awards Program and Tips for Acquiring Awards
Receivers: What do you need? What to ok for, what is new, and what is in the future.
The Hidden World of Clandestines
What is Pirate Broadcasting and Hoto Hear Them.
Scanners and Scanner Clubs
QSLing Techniques
Computers and the SWL Hobby
The Role of Clubs in the SWL Hobby

Registration Options -

FULL - Incles forums, hospitality room, lunch and banquet - $30

PARTIAL - Includes forums and hospitality room but NO meals $15

SPOUSE - Includes hospitality room and meals - $15

Please register NO LATER than February 10, 1990. Ches should be made payab to WINTER SWL FEST. Registration for hotel rooms should be made directly to the Holiday Inat (215) 368-3800 - As soon as possible! Special rates - $55 single, $59 double. Our function code with the hotel is WINTER SWL

FEST. Please refer to this to get the special room rates. Listen to the ANARC SWL NET on 7.240 at 1500 UTC Sundays for up the minute info.

Theoliday Inn is located at EXIT 31 of the PA Turnpike NorthEast tension - Lansdale Interchange. Limo service iavailable from Phila. tl. Airport directly to the Holiday Inn.

133. TS-430 Mod for below 150 KHz

Newsgroup: rec.ham-radio
Date: 1990-01-08 15:16:18 UTC
From: john@anasaz.UUCP
Message-ID: <1095@anasaz.UUCP>
Source record: 14387

If you are interested in receiving frequencies below 150 KHz on a TS-430, you might want to try this mod. I discovered this yesterday and as far as I can tell, it works (standard disclaimers apply).

Simply locate R52 on the LL circuit board. Cut the lead on this resistor.

As far as I can tell, the only effect of this is to prevent the VCO from being turned off below 150 KHz.

The receiver is not up to spec below 150 KHz (probably why they don't allow it), but is only a few dB off at 100 KHz (which is the Loran C frequency). It is about 10 dB off at 60 KHz.

Due to a faulty tape recorder, the launch of the Spot-2, Microsat, UOSAT payloads on the Ariane 40 configuration (the first 40, no strap ons) has been delayed until at least January 26 at 0135 UTC. I will post new orbital elements on CI$ and AMSAT BBS's. The tape recorder was not on the small sats of course, it was on the multi-million dollar SPOT-2 earth imaging, earth resources satellite. This quite serious delay is pushing the already delayed launch schedule for ARIANE further into the future.

> Calls placed using modems require no special telephone
>company equipment,

Statistical multiplexors look for pauses in the speech(modem) and are
able to save bandwidth by squeezing several channels onto fewer channels.
Unfortunately, 1200-baud modems never pause so the system may not be
able to carry as many modem calls as voice calls - so it may actually
be more expensive to the telco.

139. Re: Sommer Antennas

Newsgroup: rec.ham-radio
Date: 1990-01-08 20:01:48 UTC
From: n2ic@druwa.ATT.COM
Message-ID: <4582@druwa.ATT.COM>
Source record: 14407

One of the antennas available for our multi-multi effort at 4U1ITU (4U0ITU) was a Sommer antenna. I don't remember exactly how many elements the particular model had - somewhere around 5 to 7.

Compared to the Cushcraft monobanders we erected on other parts of the roof, the Sommer beam was 1 to 2 S-units WORSE. The SWR on the Sommer antenna was respectable (< 1.5), so it was apparently operating "correctly". The Sommer and the Cushcraft
beams were all at the same height (15 to 20 feet above the roof - about 125 feet above the ground).

The 4U1ITU "insiders" told us that the only reason the Sommer antenna was still up was club and international politics.

In summary, forget the Sommer antenna.

By the way, QSL info for 4U0ITU is via KC7V.

From: dml@esl.com
Message-ID: <DML.90Jan8123659@chopin.esl.com>
Source record: 14394

A friend is involved with a racing sail boat, and wants to add HF maritime communications to it for a CA to Hawaii race.

He has picked out a radio, and I think an antenna. In any case, he wants to use a vertical (pretty obviously), and is interested in knowing what the best grouding approaches for him might be.

He is aware of the possibility of using copper foil on the outside of the hull, but doesn't want to take any chances of affecting the boat's sailing performance. He has also considered using foil or some such on the inside of the hull.

Can any of you relate any experience with the tradeoffs to be made here? Any wonderful solutions?

Thanks!
Denis Lynch, N2TI

143. Re: Rapid Charging FT470 Battery Packs

Newsgroup: rec.ham-radio
Date: 1990-01-09 01:17:51 UTC
From: timb@hpmwtd.HP.COM
Message-ID: <1260016@hpmwtlb.HP.COM>
Source record: 14396

In simple terms, a battery consists of an internal EMF and some series resistance. To recharge a battery, you need simply to drive a current in the opposite direction to that supplied by the battery itself. To do this, you must overcome the EMF of the battery with an external power supply.

A charger is nothing more than a DC power supply set to a voltage that will overcome the battery EMF by an amount suitable to allow a reasonable charging current to flow.

If you want to charge a battery as rapidly as possible, you need to build a voltage regulated DC power supply that has current limiting. By setting the supply voltage to the desired EMF of the battery, a variable charging current will flow until the EMF reaches the supply voltage. The current limit protects the battery from being charged too fast. Simple designs can be found in any of the data books or application books for IC regulators.

You will have to consult the battery manufacturers data to determine the maximum charging current and recommended charging voltage.

144. Re: Vertical Suggestions Needed 40/80 meter

Newsgroup: rec.ham-radio
Date: 1990-01-09 01:39:34 UTC
From: timb@hpmwtd.HP.COM
Message-ID: <1260017@hpmwtlb.HP.COM>
Source record: 14397

Why not consider a simple rectangular loop antenna with sides that are roughly 1/8 wavelength at 80m. The loop should be broken at one side and fed with open wire line at the other. The radiation pattern is roughly omnidirectional with a few dB more gain in the direction of the side that is fed.

If the size of your building is suitable, the loop could run around the periphery of the roof. This way, any metal in the building should not affect the pattern significantly.

The same antenna can be used on both 80m and 40m by using an antenna tuner. With this approach, the antenna length need not be exact.

Should make for a good DX antenna.

73's de WB9MVP

145. Help requested: using a UHF TV tuner as an 800 MHz scanner converter

Newsgroup: rec.ham-radio
Date: 1990-01-09 03:36:51 UTC
From: mahaun@sactoh0.UUCP
Message-ID: <2396@sactoh0.UUCP>
Source record: 14398
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.electronics

About a year ago, I came across an article in an old issue of 73 Magazine titled "800-900 MHz The Easy Way" -- it was in the October 1987 issue on page 40. Basically it described a way to convert an old UHF TV tuner into an 800 Mhz scanner converter by hooking up an antenna and power supply to the tuner module, and then using the scanner to listen to the (about) 45 MHz IF output. The article was quite short and didn't describe much about the details of using specific types of tuners, although it did contain a low-drift power supply design (the tuner frequency is very dependent on supply voltage).

Around the same time, I found the following advertised in a surplus electronic & radio parts catalog (Fair Radio Sales, Lima, OH):

"UHF Tuner: UHF varacter tuner, covers 450-900 MHz; use for TV repair or modify for scanners, etc. Approx 47 MHz IF output; 300 ohm ANT input, 50 ohm OSC out. Requires +15 (B+), 3-10 (AGC) and 0-30 VDC (tune). 3.5x3.5x1, 1lb. GE #EP85X66"

Thinking this would make a fun and useful project to hear 800 MHz on my BC-100XL scanner, I went ahead and ordered the unit. When it arrived, I noted that a sticker on it read "EP86X65," contrary to the GE number quoted in the ad. It also came with a small sheet listing tune voltage vs. frequency. The unit itself is a small metal box with a clearly labeled "IF out" jack with an RCA-type connecter, and three terminals labeled "AGC," "B+," and "T".

Unfortunately, when I tried hooking it all up, I was unable to receive anything different in the 45-47 MHz range of my scanner. I think the problem may be in the currents I am supplying to the three control terminals. Does anyone who is familiar with these units know the typical current requirements for the varactor diode tune input and the AGC input? Also, I have no idea what the voltage on the AGC input should be set at to start with. There are two holes in the top cover marked L13 and L11 with ferrite slugs inside that can be adjusted -- is it possible that I need to mess with these?

Surely someone reading this has used one of these goodies before... if so, please send me an email address so that I can discuss the details with you. If I figure this out and get it working, I will post a summary of the super-deluxe $20 scanner converter :-)

Thanks in advance for any help anyone can provide on this!

> track and complaining about the train traffic.

I disagree. They're only well-known to hams that CHOOSE to invest in any of the ARRL's material. While I would relinquish the frequency to W1AW because I am aware of what it is, many hams choose not to be members of the ARRL and don't care what W1AW is. W1AW should operate as any other individual or club station has to. Despite W1AW's noble goals, I still don't believe its lofty position entitles it to take over a frequency that might be in use. Admittedly, again, I will not stand on the track because I want to prove something, but I just wanted to make the point that not every ham is even aware of the established sked of W1AW. I am a member and I would have to go look in QST right now to find where and when they operate (say, maybe I'll just do that! :-)) Don't get me wrong, I'm not quarreling about it or the ARRL's usefulness. The whole thing strikes me a little like 'eminent domain' though...

and display. Well, I have the reference for it:
Subaudible Snooping, KE6VK, 73 Amateur Radio, November 1986, pp. 48-9.
Kind of a clever circuit that uses an MF10 switched-cap filter to
isolate the tone from the rest of the audio and then a CD4046 PLL
running at 100 times the tone frequency, providing a VCO output which
is counted in 0.2 seconds and displayed on 4 seven segment LEDs. 18
chips and about $70 if you buy them all from Jameco and Digi-Key. I
might whip one up just for fun.

Source record: 14408

Got a question or two about a logging in WRTH-1990(and a couple
of other semi-old sources):

There's a listing for a US station on 11730 KHz as KJES, but I don't
see any other references to it, other than the WRTH freq-by-freq entry.
It is listed as El Paso, NM. Does anyone have any information on this
(former? current? part-time?) station? There seems to be no entry in
the US section in the country-by-country listings in the front part of
the book. Thought I would ask some people who would probably know
rather than wasting time and money on long distance calls to possibly
non-existent stations.

(BTW - our dept. mail machine and gateway are going to be down for
about 2 weeks, so mail may or may not bounce back as undeliverable.
Please send any email for the time to kgreer@mcnc.org.UUCP)

149. Cellular Phone parts on 30 cM?

Newsgroup: rec.ham-radio
Date: 1990-01-09 14:10:43 UTC
From: julian@bongo.UUCP
Message-ID: <291@bongo.UUCP>
Source record: 14401

For a few years now we have had a "new band" in the UHF range. Manufacturers have ignored it, but by God it has a band plan. The band is the 30 cm band (902-928 for those who cheated in their Novice test).

I would like to run some high baud rate packet up there. I notice that Cellular telephone and Trunking radios are between 800 and 900 Mhz. I would guess that the most widely manufactured radio these days is the cellular phone. This means to me that RF parts should be cheap and available. I am assuming that PA stages and RX front ends should be tweakable to 30 cm use with little grief.

So three questions:

1. Has anyone done this yet?

2. Anyone know a good source of data on cellular components?

3. How about a good source of parts?

Yours

150. Aurora beacon

Newsgroup: rec.ham-radio
Date: 1990-01-09 14:12:27 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9001100808.AA18238@ucbvax.Berkeley.EDU>
Source record: 14402

I have installed a continuous beacon for monitoring auroras in the northeastern part of the country. It operates from FN24, on 144.047 CW, with 35 watts to a 5-el yagi pointed north. The antenna is 12 feet above ground on an excellent hilltop with a clear shot to the north.

I would appreciate reception reports. The antenna has been designed for suppressed sidelobes (<35 db), so hearing it "direct" should be difficult. On aurora, however, the beacon should be quite loud. I am interested to know how loud it is via Au, because I would like to reduce its power if possible.

writes:

> I can't remember exacctly where I got this and I haven't tried it yet on my
> TM-701A but I know I've seen the extended frequency mod somewhere else and

I did post the mod to this net sometime ago. The main point I want to stress is
that the TM-701a will not cross band full duplex like the TM-621,721,731 etc.
It will only crossband simplex. You cannot put you favorite 2m repeater on one
band and talk through the TM701a with a 440 handi talkie. But you could dial up
your favorite simplex 2m frequency and use your 440 HT to go out on 2m.

Sampling the IF output does not imply the the IF is operating at
a low frequency. Almost everyone knows that a signal that is
bandlimited to some frequency, say F, can be sampled without aliasing
if the sample frequency is at least 2*F. What many people fail to
realize is that the sampling process is similar to mixing, and that
aliasing can be avoided provided the signal has a bandwidth of F.
It is not restricted to the span 0-F.

Consider an IF with a center frequency of 455kHz and a bandwidth of
7 kHz. If we sample at a 15 kHz rate, then anything in the span
450 - 457.5 kHz (450kHz = 30*15kHz) will mix (alias if you will)
into the span 0 - 7.5kHz. Since the original signal didn't contain
energy at any other frequencies (say 0-7.5kHz), then aliasing really
hasn't occurred since there wasn't any overlapping of spectra. At
the input to the digital filter it appears as though the IF was operating
with a center frequency of 5kHZ, not 455kHZ.

The frequenies chosen for this example aren't very good, but you
get the idea. Although the ADC in this example would be running
at 15kHz (easy), the ADC's sample-and-hold must accurately sample a
460 kHz signal (harder).

John Gilmore <gnu@hoptoad.uucp> writes:

I believe that NSA is monitoring the Internet

Well, John, so are you! Granted, the level of sophistication in what you look at is much coarser than you claim theirs is, but you certainly seem to get a look at the contents of quite a number of packets carried by that network. In fact (*gasp*), you're looking at some right now!

Anyone can do this (even in the covert sense that you're apparently affraid of), and why shouldn't they? If you require secrecy in your transmissions (same as cellular telephone, cordless telephone, etc), you need to find a way to deal with it.

And about UUNET, it has been stated for a long time that the net-to-net business was all just a matter of someone "stepping up to the plate" to take responsibility for such a link. To my knowlege, UUNET is the not the first group to take that responsibility. Certainly BBN did the same for CSNET and the NSF people have done similar things.

From: gjernes@liszt.mpr.ca
Message-ID: <2012@eric.mpr.ca>
Source record: 14416

I will be purchasing a UHF linear for use with my ATV setup and also
for satellite work.

It appears that these amplifiers come in pretty statndard input/output ranges.
I am interested in the 10W in/100W out, or higher output.

I have the following questions:

1) What have you found to be the best amplifier for these purposes?
(I am only familiar with the "RF Concepts" and the "Mirage". Are
there others?).

2) Mirage has a D1010 for normal usage, and a D1010-ATV for ATV work.
What is the difference between these amplifiers and can I use the
ATV version for satellite work without losing something?

3) Are there UHF linears with higher than 100W output available that won't
cost 10 times as much?

4) Another product I'm looking for is an audio processor (or compressor)
which can be purchased off the shelf (no time for the home project
route these days). Do you know of such a beasty? My Icom IC-271,
IC-471 and IC-1271 do not have built-in RF processors - sigh.

I will compile responses and post the results if you wish.

The way I interpreted it is that because it's legal to monitor cordless phones (and cordless intercoms and cordless baby monitors and etc) it's also legal to listen in on them for evidence purposes without a warrant. Because the cellular folks were able to ram through 'protection' against monitoring cellular freqs, police therefore can't monitor cellular frequencies without a warrant and hope to have the evidence accepted.

It's the latter that matters -- you can listen to cellular, although it's illegal. So can police. But because monitoring cellular is proscribed, any evidence received via cellular monitoring that isn't backed by a warrant will be inadmissable. A case where to 'protect' people they've created a class of criminals (all the people who listen anyway) and protect another class at the expense of the police. Nice touch...

Message-ID: <3414@cpoint.UUCP>
Source record: 14423

Enough people have asked me how to obtain a copy of my logging program
that I thought I should post.

CT (for ConTest) is a realtime logging program for IBM compatible computers.
It supports CQ World Wide, ARRL International DX Contest, CQ WPX, Worked All
Europe, and ARRL VHF QSO Party. It will control Kenwood and ICOM radios,
talk to PacketCluster for automatic spotting of DX and QSY to the DX frequency,
send the code using a serial or parallel port, and all the usual bookkeeping
of dupes and mults. Of course it prints logs, summary sheets, dupe sheets,
rate sheets and few others.

I used to distribute the program for the cost of a floppy, mailer and
postage. This became a burden, so I donated the right to distribute it
to the Yankee Clipper Contest Club. The club charges $25 for the program
with a decent printed manual and updates for major bugs, but not for all
changes in perpetuity. All revenue goes into a packet fund which pays
for computers, radios and tncs used in our network. KC1EO has donated his
time to the club and does all the production work of reproduction, banking,
user database maintainence. K1VR edited the written manual which I wrote, and
K1GQ did all the publishing work on his Mac.

The program should be obtained for $25 from:

Yankee Clipper Contest Club
c/o Bill McGowan, KC1EO
33 Truell Road
Hollis, NH 03049

I hope this does not look too much like an advertisement, it is not
intended to be.

Ken Wolff, K1EA

Hmm. I dunno, these backward overseas countries.... 8-)

Just to add some fuel to the fire, the "T" in my callsign refers to the fact I have a "limited amateur licence", which means (a) that I can do anything a "general" licencee can do above 30MHz, and (b) that I haven't passed (or in my case even sat) a code test. The 30MHz limit is an ITU reg, not inflicted on us by the (reasonably enlightened, in my opinion) NZ Radio Frequency Service. Since I live in a small flat, with nowhere to put a decent HF antenna, nor a heck of a lot of interest in such, this suits me just fine.

There is a Novice licence in this country, requiring a lousy mark in the radio theory exam and a 6wpm code test, and giving access to the 3.525-3.625 MHz and 21.1-21.2 MHz bands (also the 27.12 MHz telemetry frequency) only, with a power limit of 30 watts PEP (as opposed to the 400W PEP limit for limited & general licences). Needless to say, this isn't exactly the most popular way to get into ham radio - most beginning hams go for a limited licence.

AND there is the twin lead J-pole solution which rolls up into a small space
and sets up on your walking stick or tree or cactus, or... and gives good
gain out there where you need it. I have found the little thing to make
the difference between not keying up the repeater and a near full quieting
signal. It costs about $5 if you have to buy everything from scratch, and
weighs very little. For me it is the "cat's meow" of backpacking 2 meter
antennas. If there is any interest, I can post the construction details.

Cellular phones frequency hop as the user moves from cell to cell. This makes them more difficult to intercept -- at least over the long term.

Continuing on this subject -- I understand that users of cordless phones have, according to the courts, no right to privacy in their conversations -- it would be difficult to enforce, even if the courts said that there was such a right. So when is some smart cordless phone maker going to start selling a phone with a digital encryption chip built in? Seems like a pretty neat solution to the whole problem to me...

Actually, that wasn't Phil speaking, but it's his note where I saw it,
so... The thing to observe is that the Feds did things right (for once)
and talked about Baud, and NOT about bits per second. The two are not
the same, except in trivial modulation schemes such as FSK.

For example, I believe there exists a voice-line modem that runs at up
to 9600 bits per second, but has a symbol rate of 7 Baud. Consequently,
such a beast would be entirely legal on the HF bands. And indeed, the
latest edition (red/white/blue cover) of the ARRL's annotated FCC
rules specifically mentions this sort of modem as being legal and appropriate
for narrow-band use.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

A station that you might try is KUSW (P.O. Box 7040, Salt Lake City, UT 84107) they were one of the sources of music for the Soldiers in Panama City (they were played at high volume for Norriega) ---

They will send you a program guide and a bunch of information (including a catalog containing SW Recievers and the usual station promo stuff i.e. T-shirts etc.)

Good Luck --- John

Rick:

And just what would you be needing a radio INSIDE (?) the
computer for anyway?
I've hooked P.C's up to scanners and written programs to switch banks
and load banks with pre-stored frequencies before..and it hasn't been
a problem...although the scanner has been equipped with the necessary inter-
facing.
Are you thinking of some form of sampling set-up using a series of D/A and
A/D converters?
The only time you'd get problems from a radio receiver causing problems
is if the IF sections are not shielded..and I'll bet that would be
a very hard item to find these days.
Just make sure that you are supplying the radio receiver with power
from the computer's supply. Using an external supply is just asking
for trouble.

173. ICF PRO-80 problems

Newsgroup: rec.ham-radio
Date: 1990-01-09 23:40:43 UTC
From: jeffp@phred.UUCP
Message-ID: <2921@phred.UUCP>
Source record: 14283
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Any Sony PRO-80 owners out there experience the following?

When using the 115.15-223 MHz converter module, I get significant problems with FM stations creeping into the air band, 118-136 MHz, and even above.

I've determined this is due to imaging, by listening to the signals in AM mode (tho they are FM, so this doesn't sound too great). It is clearly the offset frequency of the converter plus the difference between that frequency and the FM station which is interferring. For example, the yechy sounding noises I get at 126.7 MHz turn out upon close inspection to be the FM channel at (115 - (126.7 - 115)), or 103.3

Co-workers who know a lot more about frequency conversion than I do say this is not an unexpected phenomenum. However, considering how well the basic radio is made, and the price of the package, I am thinking (hoping) that my particular converter is out of spec.

By the way, this problem is really bad at my house in Seattle, where I'm not only near lots of transmittors, but leaky cable systems with their own shifted versions of many FM stations. Surprisingly, it is still a significant problem on an island 60 miles away from Seattle, where there is no cable system or FM stations.

PRO-80 owners, do you hear this problem too?

>Never had any trouble with it. It could use a few more radials though :-).
>
>Bruce Thompson
>WB0QWS

Ditto. I live just under the foothills, where the cold air on top gets a gravity-assist downhill. My HF6VX has weathered at least one 100+, and several 80+ blow-outs. If it makes you feel better, guy it with some monofilament to keep it from looking like a willow tree. :v)

Put in as many radials as you can dig. The HF6VX isn't like trapped quarter waves - on 10m, it is much longer (full wave ?), and the radiation angle is lower. Interesting trap design - I still don't know how it works.

It may be interesting to put in a few more radiators and do some phased arrays.

While it definitely is not over, it happens to be the case that the allocation tables no longer list the Amateur Radio Service in the portion of the spectrum.

> Note to N5OWK, Please correct your allocation list ! Please avoid editorializing
> ^^^^^^^
>

It is already correct as it stands. I do suggest ADDING some editorialization to explain that the segment is currently in dispute due to "problems" with the legal process involved to change it from the Amateur Radio Service.

Lest anyone misunderstand, I have nothing against the W1AW code practice. The CW bands are mostly underutilized because CW doesn't take much bandwidth.

Not so with phone.

I can easily live and let live. I cut W1AW some slack because I listened to their CW practice, and was usually able to record one of the bands for later playback. I'm just wondering why they need to do it in every conceivable mode, on every conceivable band, at least three times a day. Their electric bills must be incredible ! How about just doing it in CW and RTTY ?

It seems that technology should be advanced enough so that this shotgun approach in the HF voice bands is no longer necessary. The original posting talked about 7.290. 40 meter phone QRM is bad enough without getting torpedoed by a computer.

> the equipment, and be considered 'business use", than autopatching to
> my wife and having her ask me to pick up a loaf of bread.

The difference? Whether YOU benefit or someone else. If you are telling everyone you talk to that BRAND X is great 'cuz you bought one and tried it, that's one thing. It's one consumer expressing an observation/opinion.

IF HOWEVER, X Co. PAYS YOU, you are doing business.

> Personally, I think this strict interpretation is going overboard.

Possibly. IMHO the constraint on the loaf-of-bread (or pizza) is not about business/profit strictly. It's about a category of use not intended for ham radio that at one time was intended to be covered by "Citizen's Band" and now is probably best covered by Cellular. (I repeat, this is IMHO.)
If I were a repeater trustee and the proper consideration were given (i.e., keeping it short and yielding to other "hotter" traffic...) I would not complain to someone making such a call.
(But again, this is "InMyHumbleOpinion")

This topic has been cussed and discussed ad nauseam on this net. If you have a way to access archives, you can see a lot of interesting opinions.

180. Standard radios

Newsgroup: rec.ham-radio
Date: 1990-01-10 08:37:15 UTC
From: langz@asylum.SF.CA.US
Message-ID: <9510@asylum.SF.CA.US>
Source record: 14292

Hi. My company is considering investing in a UHF radio system including four or five portable radios and a base/repeater. We'll be running on an itinerant frequency and the portables will also be set up for "talkaround", which I understand means that the portables can talk directly to each other without going through the repeater.

All we know about these radios we learned from the sales rep for Communications Research here in the Bay Area, so I want to ask about the system we find most interesting. It is made by Standard. The rep says that Standard, despite its "Acme"-sounding name, is a solid player in comms systems, specializing in marine radio and around for a long time. Can anyone tell me about the company? Will Standard be around for another 15 years? Can we get service/support? Etc.?

Also, the rep was honest (we hope) about the later resale value of radio systems. He said it is quite low. That later led some of us in the company to wonder whether we would be economically better off trying to find a used system and just replacing the crystals. Any advice?

Thanks,

181. Search for Valves

Newsgroup: rec.ham-radio
Date: 1990-01-10 13:08:55 UTC
From: evanni@cs.strath.ac.uk
Message-ID: <1458@baird.cs.strath.ac.uk>
Source record: 14293

For some time now I have been trying to obtain a particular valve for a 'ham radio application'. The valve in question is marked '6KV6A USA' and was manufactured by Sylvania.

My search of the UK for one or more of these blighters has so far failed - the best suggestion being that I contact someone in the States for them.

So firstly, if someone reading this in the UK knows where I can obtain these valves or perhaps a UK or European equivalent then PLEASE let me know. Secondly, if any of USA subscribers can tell me how I can (easily and cheaply??) get hold of them from there then I will be their friend for life.

Any info via e-mail will be GREATLY appreciated.

182. Stolen Radio Equipment Recovered in Colorado

Newsgroup: rec.ham-radio
Date: 1990-01-10 14:32:25 UTC
From: reisert@victim.dec.com
Message-ID: <9001101432.AA00467@decwrl.dec.com>
Source record: 14281

From: Alan Sieg, WB5RMG
8-JAN-1990 17:43

Well, scratch one bad-guy. Amateur radio CAN be very exciting. It so happened that late one night, an Adam's County Sheriff's Deputy observed someone hanging around the back door of a local comunications store. The officer appeared to be convinced that the suspect was an employee of the shop and was returning some test equipment to the shop. The officer withdrew, but watched from a distance. Lo and behold, the suspect then re-entered the store, and was followed by the officer. Upon detecting the officers presence in the store the suspect drew and fired twice at the officer. The officer returned fire, and guess what, the suspect lost. Everything. DEAD.

To conclude, this suspect turned out to be an electronics addict. A search of his apartment turned up the missing Red Cross radios, as well as a WHOLE BUNCH of other stolen stuff. His COLLECTION was for his own pleasure, none of the stuff he stole was sold, all of the stuff he had was stolen..... Talk about wierd.... most of the stuff wasn't even hooked up....

Anyway, the DRC has the gear back, but will not set it up all in the same station again. Thanks for the condolences and well wishes you sent anyway. At least a lot of other folks got their gear back as well, and Denver has one less Wierd-O...

73, Alan::WB5RMG.

From: Alan Sieg, WB5RMG
9-JAN-1990 19:00

Well, well, well...
More of the nitty-gritty revealed by Adams County Sheriff's Department.

The deceased wierd-o was also wanted by Italian authorities for: theft, fraud, and performing plastic surgery and dentistry (both without a license)... A warrant for his arrest had been issued last summer in Rome, and he subsequently left the country. He is suspected of burglarizing at least a dozen or so Denver area businesses, including: a restaurant, dry-cleaners, antique gallery, jewelry stores, a ski shop, and several electronics stores. He is suspected of entering this country illegally. His passion for radio equipment was apparently based on a desire to communicate with his friends in Italy.

By the way, the deputy involved received only minor bruises. His large buckle and heavy leather belt absorbed the impact from one of the bullets, and his bullet proof vest stopped another. Lucky guy, what a hero!

This 5 kHz. is effectively the low fourth IF frequency I was referring to.

>
> The frequenies chosen for this example aren't very good, but you
> get the idea. Although the ADC in this example would be running
> at 15kHz (easy), the ADC's sample-and-hold must accurately sample a
> 460 kHz signal (harder).

The difficulty of building an acceptable sample-and-hold is why Kenwood
probably (just a guess) didn't implement it this way. You would need
an aperture time under 7 picoseconds to get 12 bits of accuracy. In all
likelyhood, they use a simple mixer and a traditional fourth IF feeding
a digital-audio-type A/D. This is based on the fact they shyed away
from a DDS synthesizer, and past Japanese design philosophy.
Anyone know how they implemented this for sure?

I suspect that WWV, at least, will be around for a little while yet. I spoke an engineer in Boulder a few weeks ago, and he said that they're in the process of procuring a new time-code generator for the WWV transmitters. It will allow the WWV transmitters to transmit the year, along with the day of the year and time as part of the time code. They recently did a similar upgrade to the WWVB 60kHz transmitter at the first of the year, after the leap second.

As far as the Heathkit "Most Accurate Clock", well, its not. The RS-232 interface has some severe problems which precludes its effective use to those persons that want accuracy in the millisecond regime. If you're looking for somethat that's accurate to within a second, you'll have no problem with it. There are a number of other WWV based radio clocks on the market, though not "consumer priced" like the Heath clock.

If you're a time freak, like me, you'll really want to invest in a WWVB clock. The propagation characteristics at 60kHz are much more predictable than the HF propagate at 5, 10 and 15 MHz. We've got a Spectracom 8170 WWVB clock in use here, and there are a bunch of other scattered around the Internet.

>entitles it to take over a frequency that might be in use.

I agree with this sentiment. It occured to me that the ARRL should do what any other business is required to do if they want to broadcast on HF. They should get a commercial license and broadcast within the commercial allocations. I'm sure that they could find frequencies close enough to the ham bands that ham receivers would cover it. That would resolve the issue AND would make the ARRL conform to the rules everybody else does.

Of course, it's easier just to claim that you are "special" and get an FCC dispensation.

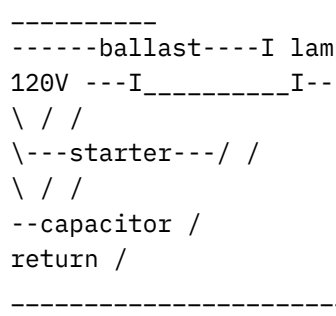
SB ALL@ALLBBS $923_WA2ISE
Florescent RFI reduction
Here is something to try when confronted with RFI from a florescent
light. I found that connecting a 0.01 to 0.1 uF @ 1.4kV capacitor will help
reduce the RFI in most cases. Connect it like this:



The 2 pins on one end of the bulb are connected to a heater filament,
and likewise on the other end. You should connect the cap so that it
has to go thru one or both filaments before it reaches the ballast
and/or the return side of the power line. This will make the filaments
act like a fuse if the cap shorts out. Be sure to use a capacitor
rated at least 1.4KV. The starter makes a large inductive spike when
it starts the bulb. It's also a good idea to use high rated parts if
you install this cap in a fixture attached to the house, for safety
reasons. And be sure to make sure that, when installed, the leads of
the cap are well insulated and can't short to anything. For florescent
lights that don't have starters, you could try putting the cap across
the bulb like above. In this case, You'll have to depend on the
ballast itself to limit current if the cap shorts. Use a higher
voltage cap like 5KV in 2X40W fixtures. Just be sure that you don't
create a safety hazard when you do this! So, proceed with caution, at
your own risk. Near as I can tell, this has no effect on bulb life.

I have two questions:

- to transmit omni-directional horizontally-polarized,
are they using some kind of 'halo' design?

- What kind of antenna would radiate a circularly-polarized
yet omnidirectional pattern? I've never seen
any circular designs other than twists and dishes.

FCC rules say that shortwave broadcasters must be broadcasting material
oriented to foreign listeners. The ARRL isn't quite that. However an
exception might be made under some circumstances, or rules changes to
allow certain special "internal" broadcasting. One thing about going
commercial is "commercial". They could actually (legally) put advertising
in the broadcasts.

> he wants to use a vertical (pretty obviously), and is interested
> in knowing what the best grounding approaches for him might be.
>
> Can any of you relate any experience with the tradeoffs to be
> made here? Any wonderful solutions?
>

I used to work in a marine electronics shop, and put a few of
these radios into boats. I might add some disclaimers, though:

1) Putting HF transmitters into nonmetal boats is a lesson in
tradeoffs and tweaks. The best solution is to use a halfwave (or a
loaded halfwave) design similar to the ham verticals now available
from Cushcraft and others. Unfortunately, these only apply to BIG
and/or slow boats like freighters which usually have wonderful steel
grounds already. The bottom line: don't expect world class
performance out of what you are asking for.

2) Sailboats are particularly difficult to work with, in some regards,
because there is not even a metal superstructure such as the flying
bridge found on sport fishing yachts. However, there is hope...

***

Ideally, a vertical antenna should be 1/4 wavelength high and
should have a perfectly conducting sheet extending from the base in
all directions in a plane perpendicular to the vertical, also 1/4
wavelength or a little more. This is 40 feet at 2 MHz, though, an
impossibility on most sport boats, and furthermore it changes with
each new frequency.

Most designs use a vertical radiator 10 ft. long and
inductively load the base, or else use a 20 to 30 ft. radiator with
inductive and capacitive loading. For a sailboat under 100 ft long,
the 10 footer is probably the way to go. In any case, the antenna
loading box is located close to the antenna base and contains some
sort of automatic tuner to optimize the match for each frequency used.

The ground is the touchy part. There are several approaches
depending on the band coverage you want (most people want them all; ya
gotta have 2182 kHz at the least). For high bands, say 15 to 30 MHz,
we usually try to install a screen (brass screen is available; use it)
directly under the match box and extending out however far we can,
usually 3 to 5 feet. The screen is tucked away in the headliner or
even tacked to the ceiling of the space beneath the match box, and is

then very solidly connected to the matchbox ground lug by a VERY SHORT piece of copper strap. For the intermediate frequencies, say 4 to 20 MHz, the best solution is usually to lay out four radials, made of 2 inch wide copper strap, from the ground lug on the matchbox to the four corners of the boat (or as far as you reasonably can go in each direction), with another two laterally laid radials if the vessel is wider than the screen. For the lowest frequencies, as well as for general electrical safety, corrosion protection of the driveline, and interference reduction, the best approach is the use of two or four sacrificial zinc hull plates, with copper strap connecting each one STRAIGHT to the matchbox. The use of the plates really does improve the performance of the system. It is possible to get low profile plates for a smoother hull; although the thinner they are, the faster they will be eaten away by electrolytic action. If they are not used, you run the risk of eating your propeller and rudder (over some time) instead.

The key to the whole system is to keep the ground elements right at the matchbox, or to use the straightest, fattest, and shortest connecting elements available to link everything together. Use any peripheral metal available, too: flying bridges, metal railings, engines, drivelines, and electrical system common busses. Theses steps will reduce the corrosion and interference to other equipment on the boat, as well.

An alternate antenna which I've heard about but have not tried, is the use of the metal mainmast as the vertical radiator. It may or may not work well, according to the particulars, but I'll bet in general they work quite well in comparison to a ten footer. Still another idea, which completely obviates the need for a super ground scheme, is to wrap the fore and aft mast stays with insulated heavy copper wire and feed it from the top of the mast (using coax to wherever the matchbox is) as an inverted vee dipole antenna. I've heard of these being used successfully, but the matching box must be able to accommodate the different impedances this will provide, and a balun is needed at the top of the vee for good broad-banded operation. This antenna will work best near its halfwave resonance point, as well.

Hope the info here is useful to your friend.

Yes! I certainly do get exactly the same behavior on my PRO-80 on
exactly the same frequencies, i.e. I can't go to ORD and listen to
all the tower frequencies without problems on some of them.

I'll bet it's difficult or impossible to fix.

BTW, are there any converters that will shift the PRO-80 into the 400Mhz
and 800-900Mhz bands? I'd hate to have to buy another radio.

209. Tips for connecting VOX recorder to a receiver

Newsgroup: rec.ham-radio
Date: 1990-01-11 13:06:35 UTC
From: parnass@cbnewse.ATT.COM
Message-ID: <12520@cbnewse.ATT.COM>
Source record: 14320
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I think those reporting "hum" problems when the CTR-82 is powered by the AC wall adapter are experiencing a "ground loop" condition. This is not a fault of the recorder itself, rather a system problem that can happen whenever an AC powered recorder is connected to an AC powered radio.

It happened with my CTR-75s until I connected them properly.

Perhaps a repost of this older article will help you interface the CTR-82. Since the time it was last posted, the Uniden 760XLT has been upgraded with a TAPE jack.

x
TIPS ON CONNECTING THE
CTR-75 CASSETTE RECORDER

by Bob Parnass, AJ9S

When available on sale, the Radio Shack CTR-75 voice operated (VOX) cassette tape recorder is a good choice for scanner and shortwave listeners. The CTR-75 has been sold since 1985 and was reviewed in a previous article.1

Another article described a simple modification to shorten the 4 second post recording delay in order to conserve tape.2 Dan Doyle, Tony Sarni, and I applied this modification to our CTR-75s with excellent results.

Since those articles, some readers have reported difficulty in connecting the CTR-75 to their scanners, and I hope the information presented here will help.

As mentioned in the initial review, the CTR-75 has 2 input jacks: AUX and MIC. They are not the same. The MIC input is more sensitive than the AUX input, and performance can vary depending on which jack you connect to your scanner.

Some scanners, like the Radio Shack PRO-2004 and Icom R-7000 have REC or TAPE OUT jacks, which are specifically designed for connection to a tape recorder. The output levels at these jacks are fixed at low levels -- enough to drive a recorder but too weak to drive a speaker. Since the levels are fixed, adjusting the volume control has no effect on the "loudness" of the signal fed to the tape recorder.

Other scanners, like the Uniden/Bearcat 760XLT, lack recording jacks, so audio must be taken from the EXT SP (external speaker) jack. The signal level at this jack is much higher than it would be at a TAPE OUT jack. It is not at a fixed level, and varies with the setting of the volume control.

The CTR-75 won't work if its MIC jack is connected directly to the EXT SP jack of a 760XLT scanner. There are at least two ways to connect the 760XLT to the CTR-75:

1. Connect the 760XLT directly to the CTR-75's AUX input, although the radio's volume control has to be slightly increased.

2. Connect the 760XLT through an attenuator ("signal reducer") to the CTR-75's MIC input. I used an old Radio Shack 51 dB attenuator, model #274-301, which last appeared in the 1983 Radio Shack catalog. The closest Radio Shack substitute is the 40 dB attenuator found in the 1989 catalog, #274-300 priced at $2.79.

Connections to various radios are summarized in the table that follows. In each case, set the VOX SENSITIVITY switch on the CTR-75 to HIGH.

CTR-75 Tape Recorder Connection for Various Scanners			
Scanner	Scanner Jack	CTR-75 Jack	Remarks
PRO-2004	TAPE OUT	AUX	TAPE OUT jack is located on rear of radio
R-7000	REC MIC	REC	REC jack is located on front of radio
R-71A	REC MIC	REC	REC jack is located on front of radio
760XLT	EXT SP	AUX	radio volume control may have to be increased EXT SP MIC attenuator pad must be used between radio and recorder, e.g., Radio Shack #274-301 or #274-300

> Novice test).

Unfortunately for us there is a "newer" band plan allowed by the FCC which provides for some other services. One of these services is "vehicular positioning" or something like that which I believe we have to defer to and apparantly has scared Southern California frequency coordinators off of the band. The other usage which is supposed to be "non-interference" amounts to "computer CB". It allows for a 1W spread spectrum source in every home for digital communication. Given the speeds of interest, such spreading only drops signals in a given narrowband slice 20 dB or so. It doesn't take much vision to see that if every home in the US tries to have a 1W transmitter to communicate that the noise floor in 902-928 will be so high as to be unusable for anything other than antenna testing on Mars.

The amateur 2.4 GHz and 5.7 GHz allocations have similarly been usurped. Recently there has been a lot of emphasis on the 2 MHz in the impending loss of the amateur 220 MHz allocation, but in the last couple of years we have effectively lost 100 times this much spectrum in truly prime regions! Our bands are disappearing fast.

>

Yes, I am developing a small quantity of "user" radios to allow access to an amateur digital IP network. The prototypes operate in the

250Kbaud region and run about 10 Watts output. Rather than using US cellular telephone hardware, I found a cheaper source in surplus Japanese personnel radio (essentially CB) hardware. The Japanese have a 903-905 MHz (if I remember correctly) band and there is a ton of surplus. Modular (brick) drivers, PA stages and PIN diode T/R switches are available for under $10 on the Japanese surplus market.

Due to the shared nature of the amateur 900 MHz allocation I intend to put together similar radios for the 1240-1300 MHz. Modular hardware is available there too though not at the same low surplus prices. Still, a 1 mW to 10-20 Watt transmit chain with PIN switching doesn't cost much over $100 for parts. I am currently using such hardware in 1296 MHz SSB transverters.

>>>> Soapbox ON <<<<<<

Even so there have been rumors that amateurs stand to lose another 20 MHz of our 1200 MHz allocation, 1240-1260 MHz at the next WARC. This would be a terrible blow because of the current digital allocations at 1248-1252 MHz.
I believe that amateur radio desparately needs a significant moderate (or better) speed digital network if it is to continue to be relevant in the information age. I'm afraid continuing as we have, while interesting to many of us OTs (I still like the glow of filaments!), offers little incentive to the technology experimenter of the 1990s.
If we are to be competitive and become something other than an anachronism, we must find ways to communicate large amounts of information quickly over a good portion of the earth's surface (at least). It's going to take co-ordination, co-operation and some spectrum to do this. Present amateur allocations of such spectrum doesn't exist below 1 GHz. I'm afraid we may lose what we do have before we make responsible use of it. I don't believe we can afford to leave it to equipment manufacturers or the ARRL to do this for us. We have to become involved if amateur radio is to survive as anything other than an arcane curiousity.

>>>> Soapbox OFF <<<<<<

Sorry about the tirade. Let me know if you want help in identifying and procuring some parts.

213. AM operation.

Newsgroup: rec.ham-radio
Date: 1990-01-11 15:39:17 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <11.Jan.90.15
Source record: 14311

Someone was asking about usage of AM. Well, it is still allive and well,
try listening on ten meters - i heard someone using an old modified
WWII transmitter and a S27 receiver not that long ago...
Also, theres a fair amount of AM still used for local 'natter nets' on
160 meters, one or two watts from a pair of 2N3053's seems popular,
also some double-sideband! (Demodulate it like SSB, and
dont worry about the 'growl' you get if slightly off-tune).
Also, us Britishers have an allocation from 70 to 70.5MHz (also available
in British areas like Cyprus and Malta). This is conveniently in the middle
of the 66-88MHz 'low-band' for mobile radio, so a large amount of the
operation on 70MHz is using converted AM and FM mobile sets (a few watts
goes quite a way!). Being a 'non-amateur band' for the 'rest of the world'
means that the big Japanese manufacturers do not make any dedicated ham
gear for 70MHz, so you have to 'roll your own' or retune commercial gear.
Theres quite a bit of activity on SSB and CW too, and also, since it is
less populated than 2 meters, a number of packet repeaters use the band.

Frequencies of note are 70.260MHz (mobile calling, AM/FM), 70.450 and
70.475MHz (FM simplex) and the area 70.3 to 70.4 is used for packet.

You often get meteor-enhanced 'Pings' from Radio Gdansk (Poland) around
70.31MHz. 70 to 88MHz is used for FM broadcast in some parts of Eastern
Europe (Poland, Czechoslovakia, Rumania, Bulgaria).

There is also a fair amount of use of converted AM CB sets on ten meters,
this is partly because many of the 'UK spec.' CB sets (FM) are quite hard
to pull onto 28MHz (they use the SANYO LC7137 PLL chip, which has the
division ratios mask-programmed in). Converted CB sets (AM, FM, multimode)
seem quite popular on 28MHz. If only they were all used by licensed hams, it
would make things better. We have a serious 'pirate' problem around the
bottom end of ten meters.

Dont think so! If the vertical is longer than 1/2 wave, the
radiation will be stronger off the end - RAISING the angle.
This is why a 1/4 wave VERTICAL on 80 makes a lousy dx antenna if
tuned for 10.

Oops, didn't see that. Thanks for the eyeglasses, Phil. :-)

The problem with this rule is that most telephone modems are 3KHz wide,
so we can't connect them directly to HF without major surgery on the
DSPs. Sometime in the future, it would be nice to get a scrapped-out
USR HST and connect it to the HF rig.

I'm an electronics hobbyist. Recently I thought it might
be fun to build a little stereoscopic video imaging system
that could be mounted on various platforms for experiments
in telepresence. To do this I need two small CCD imagers
or vidicon tubes and their associated optics and electronics,
and two small monitors, one for each eye.

It occured to me that camcorders have all this stuff and
in a compact, low-power form. Of course I don't need
or want the mechanical parts or tape transport mechanism.
Does anyone know where just the optics and electronics
for these things can be bought? Alternatively, does
anyone know where old camcorders go to die when the heads
or transports go and the owner doesn't want to bother with
the cost or trouble of replacing them? Remember, I need
two *matching* units for stereovision. Thanks in advance.

---Peter (N1CHJ)

PS -- I know this has nothing to do with ham radio but
I included that in my distribution list because
there are a lot of electronics hobbyists and
connoisseurs of electronic junk among hams.

The January 1990 issue of Popular Communications has a short article on the GTE Airfone, and the following information comes from that article.

- Channels are 6 kHz apart between 849-851,894-896,899-901, and 944-946 MHz

- When the call is initiated, the phone selects a ground station which offers the best reception. A ground station has a range of 400 miles, and there are approx. 80 of them.

- Cost of a call: $7.50/first 3 min, $1.25 each add'l min for U.S. calls

The headquarters for the system is: GTE Airfone
2809 Butterfield Road
Oak Brook, IL 60522-9000

****
******* Take a stand against censorship, act now!!! *******
****

I heard a message on the radio this morning urging listeners to
send letters to the FCC. According to the message the FCC is
considering expanding the restriction on broadcasting of objectionable
material (their definition of objectionable) from the current 16 hour
period of 6am to 10pm to 24 hours a day. They urged their listeners to
write the FCC a letter to raise objections to the ruling.

The address to send your letters to is:

Secretary of the FCC
1919 M Street NW
Washington DC 20554

****YOUR LETTERS MUST REACH THE FCC BY JAN 19, 1990.****

When I called the radio station, they also requested that you send
multiple copies of your letter to the FCC, and also send copies to your
congressional representatives and the radio station. The radio station's
address is:

KFCJ
12345 El Monte Road
Los Altos Hills, CA 94022

I'd like people to post generic letters to the FCC for people who
don't feel comfortable with their writing skills. Those people may then
cut and past their names into the letters and send them.

Please act now before it's too late.

Tony Purmal

|
|I think those reporting "hum" problems when the CTR-82 is
|powered by the AC wall adapter are experiencing a "ground
|loop" condition. This is not a fault of the recorder itself,
|rather a system problem that can happen whenever an AC powered
|recorder is connected to an AC powered radio.
|
|It happened with my CTR-75s until I connected them properly.
|
|Perhaps a repost of this older article will help you
|interface the CTR-82. . . .

I didn't see anything that would say how to correctly eliminate the
ground loop.

Anyhow, I think I'm having a different problem. I saw the note about
the sale on CTR-82s and went out and got one. I get power from an old
Archer (R.Shack) universal adapter set to 6 volts. I connect its AUX
jack (chosen after experimenting) to the earphone jack on my old
Regency scanner (I don't recall the model, it was maybe the first
10-channel programmable they sold, at least 7 years old). So far, so
good. But after recording maybe half a cassette (a C-90 if it
matters), the cutout stopped cutting out; or rather the machine would
sort of half-stop, and run at variable speeds 1/4 to 1/2 normal,
operating normally whenever a real signal from the scanner came in.
This behavior seemed to get worse, and also occurred even with a dummy
plug in the mic jack! I took the machine back to RS the next day and
swapped it for a new one. The new one shows the same behavior.

The design of the think may be half-assed. It seems as if the cut-out
mechanism is analog in some sense -- the machine seems to fade off
instead of being switched off. Before I take this one back, either
for one more exchange or for a refund, I'll make sure my 6 volts is
exactly that, and see if there is anything else obviously wrong. If
anyone knows what's going on please let me know.

/JBL

(Bob, I'd love to get hold of the information about reducing the
cutoff time from ~5 seconds to <2, if there's a convenient way for
that to happen. Thanks)

From one who lives within spit'n distance (in terms of wavelength) of the WWVB antenna array, the service is most useful and should be around for a long time.

Put a call into the Boulder office of what was the National Bureau of Standards, now the National Institute of Standards and Technology. Ask for a copy of the TIME and FREQUENCY HANDBOOK. This will give you all the information to decode WWVB and other services. The phone number for their directory assistance is 303/497-3000.

A number of years ago a group of us designed a 60KHZ receiver and microprocessor to use WWVB as a clock and signal sourse for phase locking a referance oscillator. The decode is easy. Care should be taken when designing the receiver because the forth harmonic of your TV horizontal frequency is strong and only a couple kilohertz away.

Source record: 14322

Several days ago I sent a submittal to the discussion about a paper I once read about how to increase your chances of achieving a better ground when installing a ground rod. This method involved bedding a rod in a large diameter hole backfilled with bentonite. Much to my surprise, I received several responses asking various questions, including where to get the bentonite. The source for the bentonite that I used was from a well drilling supply. Crushed benotonite is used by exploration seismograph crews for plugging shot holes. Since it swells up very greatly, it wedges itself in very tightly, and with some regular earth used to fill the hole completely full, usually prevents the shot hole from "blowing out" and venting all the energy from the explosion to the air. The research group I work for does reflection seismology and needed some for last summer's field work. Not looking all that hard turned up 2 sources in my region servicing the oil exploration industry. It was coincidental that one of the uses listed on the sack was for ground rod bedding. Apparently someone in the electric power generation business read the IEEE paper and a new market was born.

> FCC dispensation.

OBSERVATION: It used to be that W1AW would listen on the air after code and bulletin transmissions and WORK stations there. They haven't done that for quite some time now.

I got my code speed up to 13 by faithfully listening to W1AW and then comparing notes with my buddy the next day at school. At the time I had a Tech (he was an expired Novice) and we did not have HF CW privileges. Also, at that time, it was not as common to find code practice tapes (now they're everywhere!) and NOBODY had a PC.

Maybe it is time for ARRL to reconsider their activity. But if all anyone does is argue about it here on the net, they'll probably keep on doing what they're doing.

How many (NOT How LOUD, How MANY!) people feel that the ARRL should change the way they do Code Practice and Bulletins?

According to a report today (1/11/90) in CNN's "Moneyline" show, the FCC is considering changes to its rules concerning cable television systems aimed at allowing more than one company to provide service in a given area. If you are tired of the lousy service and high rates that your local company provide, the best way to achieve change is to allow for competition. If you are in favor of this change, I urge you to write the commission and support this move towards a more equitable system.

I heard this news 2 minutes ago, so I don't have the details of who to contact or where (besides, of course, the FCC in D.C.), but If anyone can confirm this story and provide more details, I and others would appreciate it.

Followups please to rec.arts.tv (since I can't think of a better place)

There has been some confusion about my Digicom cartridge (DIGICART).
The DIGICART replaces the software ONLY. Its advantages include
autobooting and ability to store parameters to the cartridge (both
almost instantaneous). A Digicom modem is still needed for packet
operation. Any questions can be referred to me here or via US mail.

In light of recent court decisions exempting cordless phones from
any expectation of privacy, Glen Sands asked if this could apply
to cellular also.

It does not. This is because the ECPA specifically covers cellular
phones, and specifically exempts cordless phones. During the heavy
$lobbying$ for the law, this came up, and the cellular lobbyists
did not want the two services confused, so they claimed that
cellular was some kind of totally different technology, and they
also claimed that cordless phones were so easy to monitor that
it would be ridiculous to pass a law against listening in!

Never mind that I have to be fairly close to the source to pick
up a 46-49 MHz cordless phone, but cellular I can listen to
all over town! Of course, for listening in on a SPECIFIC individual,
cordless is easier with the average scanner than cellular.

Oh well....good thing we have those cellular lobbyists and the ECPA
to keep us from getting 49 MHz stuff confused with cellular's
advanced technology! This must be why, when I asked a cellular
salesman if it was possible to pick up cellular calls on a radio,
he said "NO!"

"Don't cellular phones use radio waves to get the call from the phone
system to the car," I asked?

"NO, they use SATELLITES....or something".

Oh well....

Not at all. What they ruled was that people can not claim
the right to privacy when they choose to communicate via a
medium which provides no reasonable expectation of privacy.
I can expect that no one may tap my (landline) phone
conversation, at least not without a court order. However,
if I go out into the front yard and yell, I cannot expect
that no one will listen.

The Canadian Gov't, in what strikes me as a very enlightened
move, made the same determination about cellular phone some
months ago.

236. AZDEN PCS-2000 Help Needed

I got a good deal on a 1980 vintage AZDEN PCS-2000 rig at a local hamfest. I've repaired the touchtone pad on the mike and the rig is working fine. The rig currently covers 144-147.995 MHz. According to ads I found in old 73 and QST magazines the rig has MARS/CAP capability (142-149.995 MHz) built in. Anyone out there know how I can unlock these frequencies. I would like to monitor the PA CAP repeater here in Central PA. Please email responses to the address below since this info would probably interest most people here. 73.

FROM: Steven K. Roberts, Nomadic Research Labs (Winnebiko 3)
TO: All restless, creative, and slightly loony denizens of Dataspace

Hello from the Winnebiko lab! Last year, I posted an invitation to a few special people who want to abandon their current lifestyle and hit the road on a human-powered network node, freelancing for a living while traveling full time with a small ad-hocracy of like-spirited nomads. I got some fascinating responses... and some are seriously interested. Now it's time for one more "CQ" before we start firming up the initial community.

I am currently in the Santa Cruz area, building the Winnebiko System 3. It's getting completely out of hand: barely recognizable as a 54-speed recumbent bicycle, it is becoming a mobile satellite earth station, computer network with WAN links, file server, unixycle, robust ham shack, human interface research project, solar power system, and complex real-time control environment with 8 computers (not including the embedded systems). It's all quite insane... and exquisite fun.

But there's something missing. I've been living a wildly stimulating life on the road, made up of beginnings and endings -- first by traveling 10,000 miles solo, and then via another 6,000 miles with Maggie. What I'm trying to do now is reach "intellectual critical mass" by assembling a nomadic community of freelancers, all sharing the fundamental support resources of base office, email systems, account management, and logistical support... and all benefiting from the publicity and energy of the whole group. I foresee many years of open-ended bicycle travel with 4-10 people, each plying a trade, consulting, writing, doing video, or otherwise making a living through the magnificent information tools that are now available. Inevitably, some will drop out after a few months while others will join... there are no contracts or obligations beyond the simple desire to live a life of high-tech nomadic adventure shared with a few special friends.

There's a lot to this idea, and it takes a while to explain. I have thus put together a lengthy document entitled "Call to Nomadness," and this letter is just a feeler to see if you're interested in receiving a copy (level 1 filter, so to speak). During the next six months or so, we will be working more and more closely with the few wild spirits who are ready for major change, and NOW is the time for us to start finding out who they are! There are a staggering number of projects to complete between here and departure.

If you are restless, hungry for adventure, tired of the same old routines, capable of making some kind of freelance living, curious about the world, willing to get a ham license, unfazed by steep learning curves, free of major encumbrances, and intrigued by this crazy idea, please contact me. At this stage, it's all exploratory, so don't worry about committing yourself to anything -- just let me know if you seriously think you might be interested and I'll send you a detailed explanation of the whole concept. I hope to hear from you!

Viva nomadness.....

>
> Oh god, I can see it now. An ad for feminin hygene pads sent via CW!
> Can you imagine the response to that? I'll bet that ad rates would
> be measured in minutes per dollar. Oh yeah, :-) :-)

The way I am thinking that the ARRL could get a waiver of the rules requiring broadcasting on shortwave to be oriented to foreign audiences is to base it on the fact that its SPECIAL audience happens to be especially involved in shortwave already (e.g. ham radio operators and SWL'ers). To keep with the idea of such a special case audience, the advertising would also be expected to be related. So instead of hearing and seeing ads for feminine hygiene pads, expect ads for radio gear, QSL card printing, supportive ads such as from Eimac, and of course ads for ARRL membership. It can be in CW, RTTY, and even voice.

I would expect if such a "broadcasting" service were allowed, it might be restricted to CW, RTTY, and SSB (i.e. no AM so it does not become "real" broadcasting, which would require certain international "frequency hour" allocations).

I was *told* of W1AW's frequencies long ago, and didn't have to buy anything to copy their transmissions.

> Despite W1AW's noble goals, I still don't believe its lofty position
> entitles it to take over a frequency that might be in use.

Under the circumstances, I'd like to see this laid to rest until someone comes up with a way for W1AW to make a several times a day schedule with (at least) tens of thousands of listeners who have no way to mutually agree on where the noise is in *their* neighborhood, many of whom may be so new at listening that they wouldn't be able to find W1AW if it went up 15 or 20Kc.

I just saw on CNN that the Ontario police have a gadget that detects the local oscillator inside radar detectors, and they pull you over if you have such a beast running. Pretty nasty, huh? (I didn't know they were illegal in Canada - unfortunately, they showed police physically destroying the confiscated detectors. They tried confiscation in Connecticuit, and it didn't work; cops can't take it from you; how do you Canadian citizens stand for this?)

Anyhow, as far as ham-radio is concerned: do you think this gadget is precise, or is there some chance that ham radio gear, portable computers, etc. would set the thing afly? Furthermore, is it the particular design of rf detection built into a radar detector that makes it "detectable" ? I would never have guessed that a local oscillator would be strong enough to be detectable by someone a few meters away, THROUGH the car and at highway speeds. Must be a pretty sensitive device - would love to see what the inside of a microwave oven would do to it.

Are there any good VHF/UHF receivers with a wide >full< coverage (like, say, 30-1300 MHz uninterrupted), all modes, that don't cost more than about $500 or $600?

Has anyone had any experience with the Yaesu FRG-9600? At $550 discounted, this looks something like what I'm looking for. I wish its coverage (60-905) were a little greater, just for completeness' sake (for example, I'd like to have the 50Mhz and 1.2GHz bands). If the Yaesu were the best in its class, though, I'd definitely consider it. I like its small size too, since I intend to travel with this.

If you know good or bad things about the Yaesu receiver or about a better one in its price class I'd be very pleased to hear from you.

NTIA LAUNCHES REVIEW
OF SPECTRUM MANAGEMENT

STATUS: NTIA has responded to congressional pressure by beginning its first comprehensive review of the use and management of the radio frequency spectrum.

The agency is casting a wide net:

1) It is asking for input on streamlining procedures to accommodate new technologies;
2) The role of private groups in spectrum management;
3) Ways to improve FCC and NTIA spectrum management processes;
4) How to improve U.S. participation in world-wide spectrum allocation;
5) Redefinition of various radio services;
6) How to alter the current system to expedite transition from less efficient technologies;
7) The extent to which frequency property rights should be recognized;
8) Appropriate means of assessing charges for spectrum use and how those revenues should be targeted.

Other issues too numerous to mention are also included.

COMMENTS: This comprehensive inquiry raises many difficult issues that NTIA seems to feel need answers before it decides whether it will identify and release the 200 MHz of government spectrum that Congress is requesting.

Comments are due on Feb. 23, with replies due March 30.

NO COMPROMISE SEEN IN FCC
PRIVATE RADIO PROCEEDING

STATUS: The FCC's proposal to allow private land mobile service (LMS) applicants an easier way to select radio spectrum was met with either love or hate by commenting parties.

The FCC suggested that private LMS applicants be allowed to bypass the existing frequency coordination process by directly applying to the FCC for operating authority.

Since 1986, all applicants were required to obtain approval from an FCC-authorized frequency coordinator before they filed applications with the FCC. Since then, the FCC has experienced increasing service and price complaints.

One group of commentors argues that this new process will destroy the integrity of the nationwide frequency database that is now maintained by

the authorized frequency coordinator. Without that database, they claim that new and potentially dangerous interference will begin to occur.

On the other hand, an equally large group of commentors applauds the FCC proposal as a step toward fewer wasteful, time-consuming processing requirements.

COMMENTS: The FCC wants to move more of the responsibility for frequency coordination back to the applicants. It tried to do that in 1986 by requiring applicants to obtain frequency coordination from an authorized coordinator.

While that process has worked to some extent, it has spawned many complaints. This has led the FCC to propose an easier application procedure in certain circumstances.

Reply comments are due Jan. 12.

THE TIMES (LONDON), 12/12.

THREE DIAL RIGHT NUMBER FOR A LICENCE.
"Three British consortia have been licensed by the Government for the new personal communication networks, the third generation of portable telephones, which give two-way digital personal communications in the 1990s. Mr. Eric Forth, the Trade and industry minister, nominated three successful contenders for PCN licenses -- a consortium led by Mercury, a subsidiary of Cable and Wireless, one led by British Aerospace and another by STC and Thorn EMI."

Re: 75' Tower with 75' ground space

Regardless of what the *truth* of tower failures is, your neighbor will probably make the same assumptions many others would, namely, if the tower "tips over" it will fall from the base.

Convince the adjoining neighbors of the theory of tower collapse and you're on the air. Fail to convince them, and you'll have a war.

Scott O'Connel writes "I'm real close to getting my Novice......looking at 220 radios. I would also like to have a 2m mobile....."

Why not go for a HF CW rig, Scott? At least one of those in addition to a repeater rig. While most of the "state-of-the-art" activity currently seems to be on 2m and above, a great deal of fun and enjoyment of Ham radio can be had in trying to dig out that sought-after state on 40M between the commercials; or that New Zealand signal on 15M.

For less than $200, you can get a pretty fair outfit (including antenna and key) with which you can talk literally around the world, day and night. Try it...you'll like it.

That's funny, I remember when I lived in Europe that my free source of 1KV, 100nF capacitors was from old Philips fluorescent light starters. Does this posting mean that Philips no longer provides RFI protection with its starters and we have to provide our own? Worrying. But to be honest, most U.S. fluorescent lamps don't seem to have starters in them. I know there are several ways to build fluorescent fixtures. The US ones tend to be the "Instant on" type with just a monster ballast, the clicky-click starter seems to be missing on most fixtures. Some of the small lamps have starters - my old Maytag washer had a starter in it's fluorescent panel light.

But I do recall that when the cap died in a starter, radios for blocks around would suffer the effects. So yes, a good tip. Now if we could do something about mopeds and bad power line insulators. But some net members would probably say that a well aimed AK-47 would fix both of those problems.

Well, here is another Coloradoan with a Butternut HF-6VX, and
I like it, also. I originally bought it for RV/Field Day and
set it up in the yard "temporarily". I normally use 1/2 wave
dipoles at home and have used hustler whip mobile.

The Butternut is light weight, but sturdy, and has withstood
the same high winds as occur frequently here on the Front
Range of Colorado (90+ MPH at least once almost every year).
The traps may look a little funny and large, but read "High Q"
when you look at them. High Q means high efficiency, but also
means narrow bandwidth (hasn't been a problem), and a
requirement for a good ground (or counterpoise).

My ground system I put in before yard or sprinklers, and consists
of many lengths of #6 and #4 solid bare copper wire, with
3 foot ground rods at every end, buried about 18" deep in clay
soil. "Many" means probably 10 lengths of 30-50 feet (to the
edges of my lot). It certainly doesn't mean 45, 90 or 360 radials.
The antenna works well, though I prefer the dipoles on 40 and 80,
as the vertical seems a bit noisier on these bands.
The vertical loads very well on the intended frequencies (SWR
very close to 1:1). Tuneup is straightforward, so long as
you do it in the order listed in directions.

Some friends have and use several other antennas on RV's,
including the Hustler 5BTV, and older Hy Gain 14AVQ and 18AVQ
(I think those are the right designations). These antennas
look sturdier, but have lower Q traps and work OK, though
I have out-performed them on Field Day with my Hustler Mobile
whip (sometimes using HyGain resonators which seem to have
lower loss). The RV situation is highly installation-dependent,
however. I always get excellent 40 meter reports using the
Hustler on my sub-compact car (Gremlin), but others have
poor results with the same antenna on larger trucks (eg Suburban).

Another mobile choice is the ICOM automatic antenna system
which is self-tuning (I forget the number). Of the two
installations in RV's I have seen, one worked extremely well,
the other fairly poorly. Both tuned up (automatic tuneup)
well, but only one seemed to radiate well.

Lesson? Well, do a good job of installing it. That's number
one. A great antenna can do poorly if it is not installed
correctly. Number Two: I recommend the Butternut HF-6VX,
but Hustler 5BTV and HyGain 18AVQ also work well.

Just what is their definition of objectionable? I find all the prime time
violence and murder much more objectionable than an occasional 4 letter
word or a little T&A.

We all know that AM broadcast radio fades when you drive under a bridge
but FM doesn't tend to nearly as much. Why is this? Does RF at the FM
broadcast frequencies propagate better? I thought the higher the frequency,
the more it exhibited "line of sight" behavior. Or is it because AM
shows the signal reduction more directly? Shouldn't AGC take care of
that?

The AM BCB antenna the guy was talking about is the old "Select-A-Tenna" that has been around for many years. That's the brown plastic disk-shaped device you position at right angles to your AM radio's loopstick and tune to the desired frequency. I've got one, but use it seldom. (I never seem to have a convenient flat surface to sit all this stuff on. To get the most value out of it you really need to have the radio and antenna on a rotating table top. A tilt capability would help, too.)

It does work, but I always thought they were overpriced for what you got. I think there is nothing inside but a wire coil and a variable cap. Edmund Scientific and various other mailorder places carried them. The Harrington catalog the original poster saw it in is a small-format catalog of various gadgets oriented toward hi-fi, sports, and automotive uses. All their products are priced fairly high.

If you put this in for lightning protection your peace of mind isn't baseless. However for your projected tower, this has to be done a little differently. Put the ground rod at the bottom of what will be your concrete base and use very heavy conductor from the tower to this ground. More than one concrete base has been exploded apart by a lightning hit because the connection to ground for the tower wasn't solid enough.

On the other hand, if this ground rod was to take the place of a ground screen for a vertical, you wasted your time.

I've been the happy owner of an FRG-9600 for almost a year. It's a good rig. One of the things that drew me to it was the all mode functions; AM-W, AM-N, FM-W, FM-N, USB and LSB.

Here in SillyCon Valley there are a *lot* of comms out there that are not in FM-N which is the only mode most scanners support. Because of that many services are moving to other modes to avoid eavsdropping.

It might not be fair to call it a scanner because of the way the user interface is set up. It's billed as a communications receiver by the maker which seems more accurate.

I just got the CAT interface and hacked up a simple controller program for my Atari ST. Now I have 10,000 memory channels if I need them. The program also let me tap one key and append the current freq/mode as new log to my interactive logbook which also serves as the memory channel feeder. The CAT interface is essential for doing weird things like defining a custom scan step rate and speeding up the scan rate a bit.

Ah yes, the scan rate. Compared to just about any other receiver for VHF/UHF with scanning, it's pitifully slow, about 3 channels per second scan rate. Kinda slow but you learn to live with it.

The sensitivity is fine but when compared to the Icom it's not as good but it only costs about half as much.

I have still to figure out why the design engineers at Yaseu decided to limit range from 60 Mhz to about 905. Really dumb but I'm working on a mod that may get around this shortcoming.

Having had the chance to try it out alongside of other radios at the same price range (RZ-1) and less, the choice was obvious; the 9600.

Another good reason to CAT it is the fact that when you want to change modes or steps you have to press a button to cycle thru them all to get to the one you want. Another aspect of the poor hardware user interface.

The AF scan is a very nice option that will only stop on a signal if it has audio present. This is great for scanning aero-comms in AM.

The FM broadcast band picks up many stations that my Marantz stereo tuner can't even hear and the audio quality is quite good even though I use an external speaker aimed at my face rather than use the internal speaker that points upward and diffuses the volume and clarity.

The supplied whip antenna works ok and is great for a field trip but for home use in a bottom floor apartment I use a wierd 2 dimensional ground plane vertical I constructed in 10 minutes and thumb-tacked to the wall behind the rig. I'm sure if I could mount an outdoor antenna the performance would be even better. Even still I've logged over 1000 comms without hardly trying.

The bottom line, IMHO, is that in terms of bang-for-the buck it's a pretty good rig.

Well, here's a comment out of the module of ntpd for unix. It seems that
while you can get time samples from the clock, which one do you believe?

Other clocks, like the Spectracom 8170 WWVB clock, provide a seperate
TTL level output which is the on-time pulse. It is driven high for 100 ms,
with the leading edge of the pulse corresponding to the beginning of the
second.

```
/* read_clock_heath() -- Read the Heath Radio Clock.
*
* Strategy Notes:
*
* When the heath clock is set at 9600 baud and is in continuous mode,
* it will output an alternating set of two or three time strings per tenth
* of a second. For instance:
*
* 22:20:04.2 07/26/89<CR>
* 22:20:04.2 07/26/89<CR>
* 22:20:04.3 07/26/89<CR>
* 22:20:04.3 07/26/89<CR>
* 22:20:04.3 07/26/89<CR>
* 22:20:04.4 07/26/89<CR>
* 22:20:04.4 07/26/89<CR>
* 22:20:04.5 07/26/89<CR>
* 22:20:04.5 07/26/89<CR>
* 22:20:04.5 07/26/89<CR>
*
* We assume that the best place to take a time sample is at the start of
* the first string of a 3 string sequence. This is based solely on the
* guess that fitting 3 strings in 1/10th of a second means that the first
* string is closer to "on-time" than if just two strings fit.
*/
```

Some other people have asked about sources of WWV/WWVB synchronized and other
reference clocks. Here's a list of clocks and their sources:

Radio timecode receivers and other sources of synchronization

Following is a list of radio timecode receivers currently on the market.
These devices are attached via a serial asynchronous line, which is used to
send poll messages and receive responses in the following example formats:

Spectracom clock: <cr><lf>q ddd hh:mm:ss tz=zz<cr> (22 chars)
Truetime clock: <cr><lf><ctrl-a>ddd:hh:mm:ssq<cr> (13 chars)
Heath clock: <cr>hh:mm:ss.f dd/mm/yr<cr> (23 chars)

PST clock: hh:mm:ss.fff yy/dd/mm/ddd status<cr> (49 chars)

These formats are exhibited for example only. In some clocks an extensive repitoire of commands and formats are available.

In the Fuzzball implementation the Spectracom and PST clocks are polled, which return the time-code string shown, while the other clocks run continuously. In the Truetime clock the start bit of the last <cr> represents on-time, while in the other clocks the first <cr> represents on-time. In the time code ddd is day of year, hh:mm:ss is time of day, f is fractions of seconds, and dd/mm/yr is conventional (US) date. In the Spectracom clock, q is " " for in-synch or "?" for off-synch and zz is the time zone (always 00 for UT). In the Truetime clock, q is a precision estimate in milliseconds and coded as follows: "?" +-500 msec, "#" +-50 msec, "*" +-5 msec, "." +-1 msec, <sp> less than 1 msec. In the Heath clock, the hh:mm:ss.f field is displayed as 0?:??:??.? before synch is first established and hh:mm:ss.? once synch is established and then lost again.

Model 8170 WWVB Synchronized Clock ($2500)
Spectracom Corporation
101 Despatch Drive
East Rochester, NY 14445
(716) 381-4827

This is a LF receiver and decoder for the WWVB station. It is supported in the Fuzzball operating system. For expected accuracies less than 10 ms, a special one-second on-time signal produced by the clock must be used to fine-tune the indication.

Model 468-DC Satellite Synchronized Clock ($4500)
True Time Division, Kinemetrics
3243 Santa Rosa Avenue, Santa Rosa, CA 95401
(707) 528-1230

This is a UHF receiver and decoder for the GOES satellite. It is supported in the Fuzzball operating system.

Model 1020 Integrated Time Source ($1500)
Precision Standard Time, Inc.
105 Fourier Avenue, Fremont, CA 94539
(415) 656-4447

This is an HF receiver and decoder for the WWV/WWVH stations. A Unix driver is included in the NTP daemon ntpd; however, Version 4.01 of the clock firmware is required. It is supported in the Fuzzball operating system. This receiver is now being marketed by the Traconex Corporation.

Model GC-1000 Most Accurate Clock ($300)
Heath Company
Benton Harbor, MI 49022
(616) 982-3411

This is an HF receiver and decoder for the WWV/WWVH stations. It is supported in the Fuzzball operating system.

8101 Automated Computer Time Service (ACTS)
Time and Frequency Division, National Bureau of Standards
US Department of Commerce, Gaithersburg, MD 20899

This is a package of C software for the IBM Personal Computer. It can be used to call a special NBS number using either 300-Hz or 1200-Hz modem and set the computer clock. The latest version has been adapted to run on Unix workstations.

Model ? MSF Synchronized Clock ($?)
European Electric Systems, Ltd.
Woodham Mortimer Place, Rectory Lane
Woodham Mortimer, Maldon, Essex. CM9 6SW, United Kingdom
+44 24541 5785, (FAX) +44 24541 5785

This is a LF receiver for the MSF (Rugby, UK) station. It is reported they manufacture a US version for the WWVB station.

Model 5061A/B Cesium Clock ($40,000)
Hewlett Packard, Co., Customer Information Center
19310 Pruneridge Avenue, 49A
Cupertino, CA 95014

This is a cesium-stabilized oscillator which produces various outputs, including a 1 pulse-per-second output which can be used to stabilize frequency and provide accurate time when used in conjunction with a radio clock. It is supported in the Fuzzball operating system.

Chris,
Some superheterodyne radar detectors are notoriously bad emitters
of RF. One that comes to mind is the early series of Radio Shack detectors.
If you take a good detector (e.g. Escort or Passport) and point one of these
poor detectors at it from quite a distance (10s to 100s of feet) it will
sound off. The source of RF is poor isolation between the LO source and the
antenna. If you are worried about something else radiating significant amounts
of RF at the 10.525 LO frequency, try pointing a radar detector at it. If it
sounds off, then you have a problem. My guess is that the amount of RF
generated by most ham/computer equipment in the 10 GHz range is too small to
worry about. My major worry would be the police equipment responding to
frequencies other than the 10 GHz LO signal they are looking for. If you are
not using a radar detector I guess you just get the inconvenience of being
pulled over. If you are, them you had better find a local ham with a spectrum
analyser to check out its rf emissions (or obey the law and don't use it!).
Of course if you are running 10 Ghz mobile (and yes, some people have
indeed done this) then you had better make sure you have your ham ticket
with you and be prepared to do some explaining...

This is in response to a request from Keith Erskine whose mail is bouncing. It may be of interest to others since it relates to this basenote...

>
> What is your source for Japanese Personal Radio Surplus.
> I'm interested in using the 900 MHz band.

Keith
I'm afraid that my only source for *surplus* is in Akihabara district in Tokyo. I manage to find enough people going back and forth, or to get there myself, enough to keep supplied. It may be possible to get some of the stores to ship, they advertise in the JARL publication "CQ Ham Radio" and probably for enough to cover their trouble could be enticed to ship. One Finnish amateur is trying that but he hasn't reported back as to his success yet.
RF Parts has quite a few PA modules, a couple for 900 too but I haven't yet convinced them to get the PIN switches too. They finally did get both the 1200 MHz PA and driver. The driver (for $49 from them) is a pretty good thing too since it will make upwards of 4W for a milliwatt or so input. It's linear too.

Hope this helps.

Would you buy a cellular phone from this guy?
Would you buy ANYTHING from him?
Would you buy anything from ANY salesman?

While I really don't expect salesmen to be engineers, I really would
prefer if they are selling something, that they be able to tell the
exact truth about it, and do so.

But we know salesmen will lie to sell a product, **IF** they happen
to know enough about it to know the truth in the first place.

Just what frequency do these LO's operate on?

If something is ILLEGAL for anyone to own, it is normal procedure to
destroy it. They destroy drugs in most cases because they are illegal
to own. I just hope that they don't destroy something they THINK is
a radar detector just because it happens to have the same LO frequency
before that information comes out.

The British "TV police" can detect the LO of a TV set because they
all basically use the same IF frequency, or at least used to. I suppose
some of the wide-band cable-ready systems we see now days will be different
from model to model.

Remember that the sensitivity of the radar itself has to be able to handle
a signal reflected off a non-flat surface. Receivers can be very sensitive
these days.

Another interesting note is that a major radio observatory in the east
is located in Green Bank, WV which is fairly close to the Sugar Grove
listening station. Both areas are 'radio quiet' zones and any broadcast
equipment for that area goes through much more stringent licensing by
the FCC (ie. cover patterns have to have nulls in the direction of
Sugar Grove/Green Bank. I'm not sure that the folks at Green Bank would
be able to enforce a radio quiet zone, but I'm sure that Sugar Grove
can and does.

NJ has very restrictive laws about scanners, so much so that if you have any modern commercially produced rig, you can't legally put it in your car in NJ. I refuse to go to NJ. I encourage all of the rest of you to do the same. The state of NJ is saying to you, "Please don't come here; we don't want your tourist dollars."

Ontario allegedly will stop you, confiscate your amateur 3 cm reciever, and destroy it. If this turns out to be true, I will refuse to go back to Ontario. I encourage all of the rest of you to do the same. The province of Ontario is saying to you, "Please don't come here; we don't want your tourist dollars."

On a related note, there is great corruption in the Illinois State Police dept. They have a habit of stopping out of state cars, and giving speeding tickets, EVEN if the cars weren't speeding! The laws are such that you have to pay immediately, or go to jail and pay later anyway. They won't take your personal check, and they only take a small number of credit cards. They won't take Master Card or Visa! This leaves cash as your only option; the officer promptly puts the cash in his pocket and then goes to stop someone else (from out of state). I have both personal experience, and conversations with people who have had personal experience to back this claim up. About 15 years ago, this happened to my dad in Normal, IL. He tells me that he wasn't speeding. I have had conversations with two people who also got tickets in this way, one was in Indianapolis, and the other was in Rolla, MO. Both told me they weren't speeding. In addition, on my last trip through IL, I saw 7 people stopped by the police. EVERY SINGLE CAR HAD OUT OF STATE PLATES. Now I would expect that in IL, there would be far more cars with IL plates than all other states put together. I would also expect, statistically, to see many more cars with IL plates stopped by the police by virtue of their much greater numbers. I can't imagine that what I saw was just a coincidence. The state of IL has a nice scam going; I was lucky last time - I didn't get stopped. I will never again drive through IL. I hope you don't get stopped and ripped off. I encourage you not to go to IL. The state of IL is saying to you, "Please don't come here; we don't want your tourist dollars."

It's already available--a couple of ATT models have encryption built
in. I suspect that the higher price is the primary reason we don't
see more of them. I think the price was in the $400 range, which
most people won't consider worthwhile. Even the dope dealers...
(Well, why do you think they call it dope????)

Both an FM broadcast receiver and a television broadcast receiver
are available as boards for the Mac II. I think it silly. I did see
the "Micro TV" board in action at Computerware today. It's supported
as a desk accessory, and you can watch TV with a 2x2 window devoted
to the TV screen. Supposedly you can do this while doing other things,
but our attempt to watch TV while running Model Shop crashed the machine
immediately.

Incidentally, the on-screen TV image is monochrome, even on color
displays.

I am building a all home brew ATV station. I just completed the oscillator chain and have about 70mw on 439.25 . I am now looking to build the power amp and video modulator. From what I have seen and read elsewhere it would appear there are two different ways of adding the modulation.

1) Modulate the low power stage and follow it with a linear amp.

2) Feed the low power stage to a modulated class C amp.

Anyone care to comment on the methode they would choose and why?
Thanks,

Steve Look ka9szw

The IC9000 is NOT the new Icom handheld. The new radio is called the
R-1, and it covers from somewhere below AM broadcast up into the
GHz range. It is about the size and shape of the IC2SAT. The radio
is rumored to be out around time of the Dayton Hamvention. It is
already available in Japan. List price should be under 1K$, and
rumor has it that it may discount to about $600....this is ONLY
a rumor or a guess!

Another rumor: IT DOES NOT HAVE SSB OR CW! It receives ONLY AM and FM
modes. It is targeted to HF SWL/VHF scanner markets.

Should be a neat radio...too bad it only has AM and FM, but for the
size of the radio, waddya want?

278. Radio Service Question (contd)

Newsgroup: rec.ham-radio
Date: 1990-01-13 23:59:01 UTC

Howdy. I'm working on my ICOM-701 hf transceiver. I've pinned the potential source of the "funny popping noise" to Q37 on the A board. It is a pass transistor for the receive mode +9v. It is running *VERY* hot to the touch - you can't keep your finger on it.

The noise starts up when the transistor gets hot - about 20-30 seconds after power up. It is a tall plastic transistor. The complementary transistor for xmit is a power transistor with a 1sq inch heat sink attached.

The "noise" isn't present on the inputs to the transistor.

Soooo, Questions:

1) Has anybody had similar problems with their IC-701 (or any radio?) Is this a known IC-701 failure mode? BTW, I have found other components in the rig that are being pushed hard.

2) Is it probable that this transistor is shorted and/or bad?, or,

3) Some other circut is being a pig and overloading this transistor. (All circuts seem to be functioning properly excepting this "noise") I haven't had a chance to measure the current this transistor is passing.

4) Anybody have specs on this transistor? It is a 2SD468. How about an xref for substitution?

Thanks, Mike.

279. CGA to composite adapter?

Newsgroup: rec.ham-radio
Date: 1990-01-14 04:15:40 UTC
From: elmquist@NIPS.SSESCO.COM
Message-ID: <9001140215.AA01752@nips.ssesco.com>
Source record: 14183

I posted this here...because this is where all the hackers are...

I once saw a circuit (possibly in QST) for adapting the TTL RGB CGA
port on a PC to a composite MONOCHROME monitor. You ended up with 16 gray
levels instead of colors. I can't find the circuit now-- and I
need to do this kind of conversion. Does anyone have such a circuit?
Seems to me it was just a resistor ladder...but I need the values of
said resistors--

In article <1011@khijol.UUCP> erc@khijol.UUCP (Edwin R. Carp) writes:
>>I wonder if amateur radio operators are exempt from this foolishness? I
>>am active on the 3 cm band, and I do in fact use modified radar
>>detectors. I use them both for test equipment and communications
>>transcievers.
>Would you post details? Sounds interesting for point-to-point high-speed
>packet, control links, etc. for next to nothing!

Move the cavity down into the amateur band by changing the setting on
the tuning screw that protrudes into the cavity. An exsiting rig with
an IF strip tuned to a known frequency (or tunable) is useful here.
Remove any wires going to the Gunn diode, and replace them with a
regulated power supply capable of being modulated. Modulating the power
supply voltage to the Gunn diode will both AM and FM the Gunn diode.
Hook up an IF strip (perhaps with preamplifiers) to the mixer diode in
the cavity. Add a good antenna, get a friend on 3cm, point it at him,
and QSO. Wideband FM is exceptionally easy to get going, and provides
very reasonable performance.

281. Re: the dsp in Kenwood TS950

Newsgroup: rec.ham-radio

CQ DL 12/89 page 750-760 is the first part of a test of the TS-950SD
by DL1BU. He writes an good technical article about any new piece of
HF equipment. He has done a lot of measurments on the TS-950.
CQ DL is the QST of the DARC (german) The TS-950 has only a small
Englisch summary:
The new kenwood tranceiver TS-950 SD is the first to make use
of digital signal processing in amateur radio on the audio
section both for receiving and transmitting. The improvement
in signaL quality is remarkable.
This is an in-depth review of a prototype model with many
sophisticated measurments of receiver and tranmittor specifications
screen photos of morse signal, modulation evaluation,
selectivity curves both at the front-end and in the if and af
stages, sensitivity and large signal capabilities. It wil be the
first evaluation with such data worldwide, one of a later model
might follow. (DL1BU)

Some technical info TS-950SD

Tranceiver:
Pa 150Watt, 50V. The intermodualtion is more the 40db down (SSB).
The PA is capable to run one hour at full power.
Receiver:
first if 73.05Mc, second if 8.83Mc, third if 455kc
15 different bandpas filters before the first mixer.
Intercept point between 20 and 24dbm. Dynamic range 105db.
The phase noise is very low. This the best ham equipment synthesizer
DL1BU has seen on his table. It isn't a DDS.
The dsp has his own low if. The if freq was not in the first article.
Receiver modes SSB, CW, AM, FM, and FSK.
The second receiver can be used 500Kc around the main receiver.
First if 40.055Mc, second if 10.695Mc

There is more information but it is imposible to include the pictures.
I haven't seen the second article. I get the CQ DL in an circulation map.

When you can read german and want your copy of the CQ DL's
DARC e.V, PB 1155, 3507 Baunatal, Germay.

285. Callsign server (*lots* of new features!)

Newsgroup: rec.ham-radio
Date: 1990-01-14 21:57:41 UTC
From: bowen@cs.buffalo.edu
Message-ID: <15774@eerie.acsu.Buffalo.EDU>
Source record: 14190

I had some spare time this weekend and I made some *really* handy additions to the callsign server on marvin (anyone not familiar with the system see the end of this message for more info). I've still got a little ways to go, but it's far more useful than before. A quick review of new features is:

1) regular expression filters on searching
2) now allows to search multiple keys in one command
3) "more" like functionality as a form of flow control
4) callsign searches search for old calls as well as new
5) ^W (control-w) now erases last word on command line
6) ^X is a synonym for ^U
7) new output format for addressing mailing labels

The biggest addition to the system was in the search capability. I've added regular expression filters to each of the searches. You can now selectively narrow down your search to be very picky. For those of you non-Unix folks (and even some of you Unix folks I'm sure) who aren't familiar with regular expressions, I've attached a portion of the BSD man page on the subject. But suffice it to say they function very much like wildcarding (* and ?). Reading the attached man page should give you a real good start, but here are some examples to get you going right away:

city -f ^d -l ^b -s ny buffalo
Everyone in Buffalo with my initials. "-f ^d" says to allow all entries that start with a D in the first name. "-l ^b" works the same for B in the last name. And "-s ny" narrows the search to only New York State. Note the old syntax that was "city buffalo ny" is now invalid and will result in a search for all in the city of buffalo and the city of ny.

name -f ^w cronkite
A good way to find Walter Cronkite. The "-f ^w" means to only list the Cronkite's that have a W as the first letter of their first name.

city -z ^142 -s ny buffalo
This is how you would go about narrowing down the search on a city to just the first digits of the zip code. This says to allow any zip code that starts with 142 in Buffalo, NY.

city -c 0 -s ny fredonia
If you know your friend has a zero call and he lives in Fredonia, NY, you can search Fredonia and use a zero in the callsign as a search filter.

As you can see, the filters are specified with a minus sign followed by a single letter as the filter name. This is taken from Unix command line option standards. The possible filters are:

-c filter by callsign
-f filter by first name
-l filter by last name
-a filter by street address
-z filter by zip code
-t filter by town
-s filter by state

Note that using regular expressions will slow the searches down a bit. Doing all that filtering is really CPU intensive. So don't expect lightning speed.

Also added was a "more" feature similar to the Unix "more" utility. When the server thinks it's at the bottom of your screen, it prints "-- more --" and waits for you to hit a key before it goes on. At this point you can type a "return" to just list one more line, a "space bar" to get a whole new page of text, or a "q" to quit output for this run. The server assumes your terminal is 24 lines long. If this isn't correct you can tell the system with the new "more" command. If you tell it your terminal has 0 lines, the "more" feature is turned off.

The system also now knows enough to search the "previous call" field if it can't find the call you are looking for as a current ham call. This will help out those that are looking for people from yesteryear who have recently changed callsigns.

Sending the server a control-W now causes it to backup over the last word you typed. This is a standard (at least in my world) that is helpful if you don't want to blow away the whole line with a ^U but would like something a little faster than backspaces. I also made ^X the same as ^U. I was told this is a standard in some systems as well.

And last, but not least, there's a new output format that makes the output look like US Postal Service addresses. This might be used if you want to send out a ham-fest announcement to all the hams in a given city. You can just do a city search and trap the output directly. Then when you get a hard-copy, just tape it on the mailing. Hope this is useful.

Well, that's about it. Now, for those of you who don't know anything about this, the callsign server is a program running on the Internet on the host marvin.cs.buffalo.edu (128.205.32.4) on port 2000. It speaks the telnet protocol (pretty well, anyway) and you can access it if your site is on the Internet. The way you do this is site specific, but the command syntax is probably something like:

telnet 128.205.32.4 2000

If this doesn't work for you, I'd recommend talking to you local system administrator. The "info" and "help" commands can get you started.

For those of you not on the Internet, a mail based server is getting much closer... Have fun.

Devon

REGULAR EXPRESSION SYNTAX
A regular expression is zero or more branches, separated by `|'. It matches anything that matches one of the branches.

A branch is zero or more pieces, concatenated. It matches a match for the first, followed by a match for the second, etc.

A piece is an atom possibly followed by `*', `+', or `?'. An atom followed by `*' matches a sequence of 0 or more matches of the atom. An atom followed by `+' matches a sequence of 1 or more matches of the atom. An atom followed by `?' matches a match of the atom, or the null string.

An atom is a regular expression in parentheses (matching a match for the regular expression), a range (see below), `.' (matching any single character), `^' (matching the null string at the beginning of the input string), `$' (matching the null string at the end of the input string), a `\' followed by a single character (matching that character), or a single character with no other significance (matching that character).

A range is a sequence of characters enclosed in `[]'. It normally matches any single character from the sequence. If the sequence begins with `^', it matches any single character not from the rest of the sequence. If two characters in the sequence are separated by `-', this is shorthand for the full list of ASCII characters between them (e.g. `[0-9]' matches any decimal digit). To include a literal `]' in the sequence, make it the first character (following a possible `^'). To include a literal `-', make it the first or last character.

AMBIGUITY
If a regular expression could match two different parts of the input string, it will match the one which begins earliest. If both begin in the same place but match different lengths, or match the same length in different ways, life gets messier, as follows.

In general, the possibilities in a list of branches are considered in left-to-right order, the possibilities for `*', `+', and `?' are considered longest-first, nested constructs are considered from the outermost in, and concatenated constructs are considered leftmost-first. The match that will be chosen is the one that uses the earliest possibility in the first choice that has to be made. If there is more than

one choice, the next will be made in the same manner (earliest possibility) subject to the decision on the first choice. And so forth.

For example, `(ab|a)b*c' could match `abc' in one of two ways. The first choice is between `ab' and `a'; since `ab' is earlier, and does lead to a successful overall match, it is chosen. Since the `b' is already spoken for, the `b*' must match its last possibility-the empty string-since it must respect the earlier choice.

In the particular case where no `|'s are present and there is only one `*', `+', or `?', the net effect is that the longest possible match will be chosen. So `ab*', presented with `xabbbby', will match `abbbb'. Note that if `ab*' is tried against `xabyabbbz', it will match `ab' just after `x', due to the begins-earliest rule. (In effect, the decision on where to start the match is the first choice to be made, hence subsequent choices must respect it even if this leads them to less-preferred alternatives.)

There is also a PD program for the Mac. It call a a 1-804 number,
and if done off peak (from Chicago) costs about 15 cents to set the
Mac clock.

It is small and I can mail it to anyone that has binhex 4.0.

To ALL:
The Clear Lake Amateur Radio Club will be conducting a Novice Class
starting February 17, 1990. It is planned to be about 6 weeks. It will
be every Thursday at 7:00 pm. If you have any questions (you do, right?)
please call Bob or Kevin @ 488-2036.

THIS IS YOUR CHANCE! GET THE LICENSE YOU HAVE ALWAYS WANTED!!

73'S and hope to see ya there.

Message-ID: <5440011@hpcvck.CV.HP.COM>
Source record: 14198

I looked for a type accepted radio for use on ham bands and also
the local search and rescue channel. I got information from an ad
in the back of Popular Comm. from:

AXM Incorporated
11791 Loara St
Garden Grove, CA 92640-2321
(714) 638-8807

The VHF(138 - 174 MHz) unit has 99 channels, sub-tones, 40 watts
(5-20 W lo power), and a list price of $849.

Has anyone seen or used one of these units (or the UHF version, $970
list)?

Until the local emergency services office deceides exactly what the
"ham mission" will be, I'm content to listen on the Kenwood 721!

>(if it's been ported to XENIX) or the UNIX version (I'll port it myself).

This reminded my of something i found on the alphacm bbs a long time ago. I pulled it off of tape and tried it. It is called nbs_time.tar.Z, and includes a C program and a 286 Xenix binary. I tried it, and it works, it dialed into NBS at 1200 baud on port tty1a (the defaults) got the time and set it for me. My system time is now within 4 seconds of that which is displayed on my cable converter box (assuming that is right). If you are interested in getting this program DO NOT reply to this message, instead send the following message to the archive server on my system, archive@mgse, and you will get the uuencoded compressed tar file back along with the system help file.

```
- cut here -------------------------------------------------
set uuencode
set compress
send other/xenix/nbs_time.tar.Z
help
- cut here -------------------------------------------------

SB ALL @ AMSAT $ANS-008.01
MICROSAT - UOSAT LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 008.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

Late word from the Ariane launch complex in Kourou, French Guiana
is that the SPOT 2 - Microsat - UoSat launch will be delayed by
at least two additional weeks. Currently, the earliest possible
launch date is given as 24 January 90.

This delay results from a problem that has been discovered in the
primary SPOT 2 payload. It will be necessary to "de-stack" the
fairing and payload assembly and remove the SPOT 2 spacecraft in
order to replace an onboard magnetic tape recorder.

The Microsats and UoSats will be left attached to the ASAP mounting
structure but the solar panel covers will be remounted and the
structure will be placed under a protective cover while this work is
carried out.

Currently Dave Cowdin, WD0HHU, representing AMSAT-NA; Junior DeCastro,
PY2BJO, representing BRAMSAT; and Maarten Meerman, G7DQE, representing
UoSat are in Kourou closely monitoring mission status and tending
to the six amateur payloads.

/EX
SB ALL @ AMSAT $ANS-008.02
AMSAT LAUNCH INFORMATION NETWORK

HR AMSAT NEWS SERVICE BULLETIN 008.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

The AMSAT Launch Information Network is on hold as is the Microsat -
UoSat launch. The plan is still to carry out the ALINS activity from
0100 to 0230 UTC on the day of launch.

Frequencies of major HF re-transmissions around North America and
around the world will be re-published the week before the next

scheduled launch attempt.

The deadline for obtaining a reservation on the call-in teleconference network bridge has been extended through Sunday January 21 on a first come first served basis. After that date, slots will no longer be available. To reserve a position for your repeater or linked facility call Courtney Duncan, N5BF, at 818-957-8455. Be prepared to leave your name, address, phone number, repeater call, frequency, and coverage area on an answering machine. All participants will be contacted not sooner than two or three days before launch with the telephone number and time to call in to the bridge.

Rich Ensign, N8IWJ, reports that launch video will be carried on Spacenet 1, Transponder 4 (Channel 7). Rich has recently confirmed this through the Arianspace office in Washington, DC.

In addition to the launch audio itself, the ALINS programming will carry information from and commentary by radio amateurs who are involved in the Microsat effort.

SB ALL @ AMSAT $ANS-008.03
PRE-LAUNCH MICROSAT KEPLERIAN ELEMENT SET

HR AMSAT NEWS SERVICE BULLETIN 008.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

SPOT-2 / MICROSAT / UOSAT KEPLERIAN ELEMENT SET

If the SPOT-2/Microsat/UoSat launch occurs on 26 January 90, the following element set may be used to estimate satellite positions for the first few days. Nominal launch is expected to be around 0135 UTC.

If the launch occurs on another day, simply add 0.98561226 degrees of RAAN per day to the listed value.

Following deployment, all seven satellites will be in close proximity for several days. By the end of the first week, users with high gain antennas will begin to find the cumulative position differences per satellite growing large enough to cause significant pointing errors. All users will begin to notice the changes in AOS and LOS time.

Element sets resulting from on-orbit measurements will be provided ASAP shortly after launch and for the first several days when available until data from the standard sources becomes available.

Satellite: SPOT-2, UO-D, E, Microsat-A, B, C, D
Catalog number: not yet assigned
Epoch time: 90026.0816319
Element set: pre-launch

Inclination: 98.738 deg
RA of node: 101.8983 deg
Eccentricity: 0.00134
Arg of perigee: 110.95 deg
Mean anomaly: 297.18 deg
Mean motion 14.1988896 rev/day

SB ALL @ AMSAT $ANS-008.04
MICROSAT AND UOSAT FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 008.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

MICROSAT AND UOSAT FREQUENCIES AND DEPLOYMENT ORDER

The following are the Microsat and UoSat listening frequencies
and modes listed in order of deployment. The OSCAR numbers
listed are, of course, tentative and assume a succesful
launch ahead of FO-1B.

Spacecraft OSCAR number Frequency, MHz Mode

UoSat D UO-14 435.070 9600 bps AFSK AX.25
UoSAT E UO-15 435.120 9600 bps AFSK AX.25
PACSAT PO-16 437.025 1200 bps PSK AX.25
DOVE DO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT WO-18 437.075 1200 bps PSK AX.25
LUSAT LO-19 437.150 1200 bps PSK AX.25
LUSAT - CW LUSAT 437.125 12 WPM CW telemetry

Packet transmission from DOVE may be monitored with an unmodified
TNC-2 or clone, using an FM receiver. The other microsats
(PACSAT, WEBERSAT, and LUSAT) require an SSB receiver and TNC
with a 1200 bps PSK demodulator (FO-12 compatible, NOT the 400
bps PSK demodulator used with AO-10 and AO-13). The 9600 bps
modulation scheme used by the UoSats is compatible with K9NG and
other similar 9600 baud modems commonly used in terrestrial
packet applications.

/EX
SB ALL @ AMSAT $ANS-008.05
MICROSAT LAUNCH TIMELINE

HR AMSAT NEWS SERVICE BULLETIN 008.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Field Operations Jack Crabtree, AA0P,
recently obtained the following preliminary launch sequence

timeline from Dave Cowdin, WD0HHU, AMSAT's man on the scene in
Kourou, French Guiana. This schedule should be followed, at least
approximately, regardless of the time and day of launch. All
times are Mission Elapsed Time.

00:00 Ignition (Time is minutes:seconds)
00:04 Launch vehicle clears gantry
02:34 1st stage fuel expended
02:39 1st stage separation
02:42 2nd stage ignition
03:40 Fairing separation
04:48 2nd stage fuel expended
04:48 2nd stage separation
04:53 3rd stage ignition
16:44 3rd stage fuel expended
16:49 3rd stage separation
17:06 SPOT II separation
20:06 UOSAT E separation
20:07 UOSAT F separation
21:01 Pacsat separation
21:02 DOVE separation
21:03 WEBERSAT separation
21:04 LUSAT separation

Dave reminds us that with this configuration of the Ariane IV, there
are no solid or liquid strap-on boosters. He also reports that there
was a surprising amount of room left in the payload fairing in-spite of
the seven spacecraft mounted in it. It was necessary to add 800 pounds
of lead ballast because of excess lift capability.

/EX
SB ALL @ AMSAT $ANS-008.06
PACSAT TELEMETRY EXAMPLES

HR AMSAT NEWS SERVICE BULLETIN 008.06 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 1, 1990
TO ALL RADIO AMATEURS BT

The following is an actual frame captured during the final test for
AMSAT-NA at Kourou. This is from a regular TNC in monitor mode
using a PSK demodulator.

PACSAT-1>TIME-1:PHT: uptime is 000/00:02:50. Time is Mon Dec 11 10:30:34 1989

PACSAT-1>TLM:00:FF 01:93 02:FF 03:75 04:FF 05:9D 06:82 07:7F 08:68 09:8E 0A:A4

2C:00 2D:26 2E:00 2F:7C 30:7B 31:7B 32:3E 33:00 34:7D 35:7D 36:7D
37:7D 38:7D 39:9D 3A:01

PACSAT-1>STATUS: 00 00 00 80 B0 18 55 02 00 80 00 00 B0 00 00 00 00 00 00 00

PACSAT-1>WASH:wash addr:26c0:0000, edac=0xac

Explanations:

Telemetry is sent once each 10 seconds. The time message is the first in each cycle, the wash message is the last. Note that the wash message does not contain a trailing CR.

The TLM block entries are in the format CC:NN where CC is the channel number (in hexadecimal) and NN is the telemetry count for that parameter, also in hexadecimal, with a range of 00 to FF (0 to 255 decimal). Equations for converting these values into engineering units have been released and are being included in preliminary telemetry decoding software.

The uptime value is the days/hh:mm:ss since the software was last loaded. Onboard software uses this for timing since it is never changed. The other time value is UTC, and can be corrected for drift from the ground.

There are various other messages that come out in response to uplinked commands, so your telemetry programs should only try to parse packets that are "to" TLM, STATUS, or TIME-1.

This format is designed to give something interesting to watch to the largest number of people possible, even those without additional software. In the future a more compact binary telemetry format will be used for the high-rep rate telemetry, with only occasional frames in the above format. This is to conserve downlink time.

Submitted by Harold Price, NK6K

An IBM compatible diskette with all available relevant information and a decoding program is being mailed to command stations and Command Station Development Program team members at this time. Others may obtain copies from AMSAT HQ.

Subj: TAPR Annual Meeting Announcement

SB TAPR @ USA < W3IWI $31481_W3IWI
TAPR Annual Meeting
R:900110/0052z 31481@W3IWI.MD.USA [Balto/Wash MD/DC/VA/DE] Z:21029

ANNUAL TAPR MEETING - TUCSON AZ - SATURDAY AND SUNDAY - FEBRUARY 24th - 25th

The TAPR annual meeting will be held at the Inn At The Airport, 7060 South Tucson Boulevard, Tucson AZ, 85706. The Inn is a very short distance from the airport terminal, walking distance if you're so inclined. Special rates for the meeting are <cheap> for either one or two in a room. Breakfast is included as well as a late afternoon cocktail hour. Our room block will be released on February 9, 1990 so get your reservations in prior to that date. Call 1-800-772-3847 if outside Arizona, 602 746-0271 if in Arizona, or write the above address. Cite The TAPR Conference to assure rates.

There will be a registration fee of <not much>. This fee will help to defray meeting costs plus lunch and private dinner at the hotel. Since breakfast and cocktail hour are provided to those staying at the hotel the overall cost is quite nominal. The Sunday session should be completed by noon or shortly thereafter for those planning return travel on Sunday afternoon.

Networking, that's the packet radio buzzword for the early '90s. And that will be one of the main topics at the 1990 TAPR annual meeting. Equally exciting will be discussions by members of the Microsat team describing and graphically displaying the construction, pre/launch and launch activity of the Microsats and their UoSAT cousins.

Expect to see many of the manufacturers of packet equipment present with displays and demos. Some have already contacted TAPR for arrangements. All the new TAPR kits will be shown and discussed.

Those wishing to be on the speaking agenda should advise the TAPR office as soon as possible. The Sunday session should be concluded near or shortly after noontime for those planning afternoon departures.

[W3IWI note: Actual <prices> were deleted from the TAPR-provided text to avoid problems with commercialism]

Subj: Launch Change -- for packet

SB ALL@AMSAT < W3IWI $32146_W3IWI
MICROSAT/UoSAT: Launch now Jan.21
R:900113/0353z 32146@W3IWI.MD.USA [Balto/Wash MD/DC/VA/DE] Z:21029

The following news was received from the crew in Kourou on Jan.12. Note that the Jan.21 UTC date puts the launch at 20:35 EST on Saturday night, Jan.20.

Arianespace announced today that the launch of V35 is now set for January 21, 1990 at 01:35 UTC. The composite will be moved to the launcher on Monday, January 15th.

Arianespace is making special provisions for the MICROSATs and UoSATs so that we don't have to go through another 21.5 hours without battery charging like the last time. The most we will be off is about 12-14 hours.

After we reconnect at the block house, we will charge for 16 hours.

The replacement tape recorder for SPOT-2 was installed yesterday and the SPOT people were pleased with the functional testing. More importantly, NOTHING DROPPED ON THE MICROSATs or UoSATs during this critical repair operation. The work on SPOT has now finished, and we have removed the protective covers from our satellites again.

293. AMSAT Microsat launch confusion

Newsgroup: rec.ham-radio
Date: 1990-01-15 09:26:07 UTC
From: karn@ka9q.bellcore.com
Message-ID: <18960@bellcore.bellcore.com>
Source record: 14197

Please note that there has been quite a bit of confusion as to the time of the upcoming AMSAT Microsat launch on Ariane. A variety of problems has caused a series of schedule slips. Because they could not always anticipate how long a given problem would take to fix, Arianespace has sometimes pushed the launch date back by an overly conservative amount only to pull it forward again by a smaller amount when the problem turned out to take less time to fix than that originally estimated.

As of the time of this article, the launch is CURRENTLY scheduled for January 21, 1990 at 01:35 UTC (that's this coming Saturday evening in the USA). Keep watching the bulletins in case there's another change.

I have the impression that the FCC is extremely lenient on
most producers regarding "objectionable". What exactly are they
threatening to censor? The Playboy Channel? Sorry, but I'd have to
SUPPORT that move.

Thank you for including the name and address of the station:

> KFCJ
> 12345 El Monte Road
> Los Altos Hills, CA 94022

Unfortunately, I didn't find a KFCJ, tho I DID find KFJC
at (415) 941-2500. Maybe it's a typo.

> I'd like people to post generic letters to the FCC for people who
> don't feel comfortable with their writing skills. Those people may then
> cut and past their names into the letters and send them.

Hmmm... generic letters? Why? Why can't people THINK enough
to write their own letter(s)?

> Please act now before it's too late.
>
> Tony Purmal

Are you sure this isn't another 'hoax'?

Something's getting reversed: the burden of censorship ought to
be on the broadcaster, not the listener. The same logic that says some
TV station can transmit in clear air an un-edited Nightmare on Elm Street,
"If you don't like it, turn it off", says that I can't scan 800 MHz,
"It's not meant for you, don't listen". The doctrine of free speach
does not mean that the speaker is free to use foul language or graphic
violence, because someone could be listening who ought not to be

to be subjected to that garbage. Likewise, if someone wants privacy
while discussing a sensitive topic, he better not assume that no one
is listening who "shouldn't be", just because it's illegal.

"What you believe [an act of your will] won't affect reality [facts; truth],
but it will affect your attitudes and actions, which will in turn affect
how reality impacts you."

295. HELP!! Need Mods for IC-04AT, PLEASE!!

Newsgroup: rec.ham-radio
Date: 1990-01-15 16:14:37 UTC
From: marke@hpscdc.scd.hp.com
Message-ID: <5490084@hpscdc.scd.hp.com>
Source record: 14200

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

Mark Espinosa/WA6RGD

296. RF progagation

Newsgroup: rec.ham-radio

Message-ID: <9001151726.AA01938@ti.com>
Source record: 14223

Phil Ngai asked about why AM radio fades when you drive under a bridge but FM isn't affected nearly as much.

It's not so much a function of the modulation mode as it is the frequencies in use. In a way, the bridge acts like a capacitor. The longer wavelengths of AM broadcast signals can't get through (into) the opening because the opening is a small fraction of the wavelength (200 meters or longer). On the other hand, broadcast FM signals are shorter wavelengths, on the order of three meters, and can easily pass through most bridge appertures. I have an idea that everyone who has ever owned a radio asks this question, so it's not so naive, Phil.

73,
Dube Todd N5PDK

>> WWVB clock.

If your not as much of a time freak as Louis, and all you want is to
set the time on your computer, you may be satisfied with the dial-up
time service provided by NIST. The number is 303-494-4774, 300 or
1200 baud. It was rumored that they would be adding a 900 number, but
I've never heard about it.

When you connect, it prints a banner then starts dumping time stamps
to you (much like the WWVx synced clocks do). If you echo the time
stamps back, it computes the round trip delay and (assuming the
one-way delay is half) advances it's time stamps to you so they arrive
on time. If you type a question mark when you connect, it will send a
help text documenting the format, etc.

This method doesn't have the long-term accuracy that a WWVx clock has
(since you can't stay connected forever), but it's better than the
local phone company!

>Sounds interesting, but expensive. How much would something like this
>cost?

Dunno. But the NIST time service would probably be a local call for
you (Jeffrey)! It may be what you're looking for.

x
BUYING A USED SCANNER

by Bob Parnass, AJ9S

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are replete with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

For this reason, you should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. My personal experience with Uniden (the new manufacturer of Bearcat and Regency scanners) has been disappointing. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105) to find out their current rates.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should to avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Peter-

sen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit in which crystals were held in a rotary "turret."

Perhaps the best known early scanners were the Regency TMR and Bearcat units. The first Bearcat was rather crude, providing no way to lock out channels from the scan. The first scanners came in single band models, followed by multiband models.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

More Modern Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features, but the older models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack

units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hob-byists do.

A few years ago, Regency and Bearcat were purchased by Uniden, a Japanese company.

My two favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004 (now replaced by the 400 channel PRO-2005) and the ICOM R7000. The ICOM is more of a "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Uniden/Bearcat 200XLT, although it's the Icom IC-2GAT scanning 138-174 MHz walkie-talkie that goes wherever I do.

ICOM

R-7000: At about $1000, this is the Cadillac of VHF/UHF receivers. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004 instead for about $400.

UNIDEN/Bearcat

800XLT: 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than

other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC350: 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular, now discontinued. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC300: 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC20/20: 40 channels. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250: 50 channel discontinued model. Rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260: Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. Method of connecting an external speaker is awkward.

BC100: First programmable portable. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT: Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC101: First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. Three work.

Bearcat_12: One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. No aircraft band coverage. Crystal positions must be arranged by band.

Regency

TMR_series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be over-

come by connecting two front ends via a capacitor). Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up ad hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times, but power off/on restores sanity. Not all that bad a deal if cheap. Replaced by Regency ACT units.

WHAMO-10: Regency's first synthesized scanner. Discontinued long ago. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use.

K500: Nice wood-like cabinet. Discontinued 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500, but now discontinued. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: Discontinued 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: Discontinued 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack1

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and today's scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance.

No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2001: Early, discontinued single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: Discontinued 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Front mounted, vertical speaker always a win.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage,

no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig2

4530: Discontinued Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

---

1. Radio Shack scanners are manufactured by General Research Electronics of Tokyo (GRE).

2. Craig is a division of Pioneer.

>
> Bruce Harrison WB4MJG
> Univ. of Tennessee at Martin
> BRUCEH@UTKVX (bitnet)

Yes you read the earlier message right. ICOM will be introducing 3 new receivers in the near future. They are 1) A hand-held receiver, 100KHz to 1300 MHz, 100 channels, in the same case as the IC2SAT. List price around $600.00, discounted around $450.00. 2) Mobile version of the same with upper end frequency coverage to 1800 MHz. Unknown number of channels. Price (discounted) probably around $ 590.00. 3) Stripped down version of R-71. This may just be the ticket for those of you who are interested in SWL'ing, need a good radio, but don't want to spend the farm. Estimated price unknown. All radios will be introduced at DAYTON ! (Be there !)

NOTE: All of this info was available in Monitoring Times Magazine.

73
Gene WA1UXA

P.S. To the individual who posted the info about the R-9000..... Last time I checked the '9000 was not a hand-held radio :-)

<We all know that AM broadcast radio fades when you drive under a bridge but FM doesn't tend to nearly as much. Why is this?>

I'll leave the real answer to someone else, but thought readers might enjoy an anecdote on the subject. The following paraphrased letter to the editor appeared in Radio Electronics magazine in the mid-sixties:

"When I drive through a tunnel, FM is okay, but all AM stations suddenly vanish. What should I do?"

The editor at the time (whom I believe was the same guy that edits Popular Communications today) replied:

"Stay away from tunnels! You're a menace to the entire AM broadcast industry!"

(Hope this was helpful, Phil! :-)

Operated by the Marshall Space Flight Center
-=-

Amateur Radio Retransmission of Shuttle Audio/Video

NOTE: This information is unofficial, and its accuracy is not guaranteed.

The Goddard Space Flight Center Amateur Radio Club (GARC) has transmitted,
by Amateur Radio, NASA Select audio on the following frequencies:

75 Meters: 3.860 MHz U.S. and Canada coverage *

40 Meters: 7.185 MHz World wide coverage *

20 Meters: 14.295 MHz World wide coverage *

15 Meters: 21.395 MHz World wide coverage *

10 Meters: 28.650 MHz World wide coverage *

AO-13 (AMSAT OSCAR-13) Satellite; 145.945 MHz. Primary; 145.955 MHz.
Alternate. This Mode B requires a satellite-high gain antenna

* Coverage is dependent on Solar Activity and Ionosphere conditions. With a
good short-wave receiver and outside antenna, reception should be
possible. Due to ionospheric conditions and time of day/night, certain
bands have better reception. A search of each band is recommended.

The GARC plans to re-transmit Shuttle video on Amateur TV for hams and ham
TV watchers in the Washington, DC area. Contacts at GSFC: Russ Jones,
N3EGO, or Frank Bauer, KA3HDO.

The Marshall Center Amateur Radio Club will re-transmit NASA Select audio at
147.100 and 145.100 MHz. These transmissions can be heard only in the local
Huntsville, Alabama area.

People in the greater San Francisco Bay area and Sacremento can view the
mission via the W6NKF Amateur Television repeater on MT.Diablo which operates
on 427.250 MHZ with vertical polarization. Those with cable ready TVs and VCRs
or cable TV converters can tune this equipment to channel 58 in the CATV
format and by hooking up an outside TV antenna should be able to receive the
telecast. This makes the service available to the general public, including
schools, colleges, etc.

Shuttle audio is re-transmitted in the Minneapolis/St. Paul, Minnesota area
on 145.150 MHZ during Shuttle flights. Additionally, during some flights,
the audio is also re-transmitted by the 3M ARC repeater (WB0BQG/R) on

147.120 MHz FM.

In the Los Angeles area, Shuttle air-to-ground audio may sometimes be heard on VHF at 145.460 MHz.

The WB4LA repeater located in Dayton, Ohio on 145.110 MHz, re-transmits Shuttle Select audio.

Shuttle audio is available in the Pheonix, Arizona area on 449.000 MHz FM.

The Coastal Plains Amateur Radio Club provides Shuttle Audio on the WD4EVD Repeater in Ashburn, Georgia on 147.285 MHz FM.

During STS missions, NASA Select audio is available on Amateur Radio repeater WD6BNO/R, transmitting on 52.220 MHz, with coverage in the central San Joaquin Valley, California. Coverage includes Bakersfield to Stockton. ENJOY!!

The Ames Amateur Radio Club re-broadcasts NASA Select Audio on 145.580 MHz. The signal orginates from the NASA-AMES Research Center in the heart of the Silicon Valley, Mountain View, Ca.

NASA Select video is available for those who have a line-of-sight path to Black Mountain via Amateur TV. For ATV details, write:

AMES Amateur Radio Club, P.O. Box 73, Moffett Field, Ca., 94035-0073.

The Johnson Space Center supplies NASA Select Audio on 146.640 MHz FM, via the W5RRR repeater.

From WB4CXD: Shuttle audio can be heard in Birmingham, Alabama, on 145.380 MHz direct, and via the N4AHN repeater on 145.150 MHz.

If visiting the "MILA" (Meritt Island Launch Area) at Cape Canaveral, Fla., you can hear launch and air-to-ground audio on the K4GCC repeater on 146.940 MHz.

NASA Select is on 444.300 (NN0V) and 146.400 MHz in the Cedar Rapids, Iowa area.

=====

From Ron Parise, ASTRO-1 Shuttle Astronaut:

Hi Folks!
This is in response to the question about shuttle frequencies. I tried to reply the other day but apparently it didn't work. The space shuttle transmits on three frequency bands, UHF, S-Band, and Ku-Band.
The UHF frequencies are simple AM voice and very easy to copy. These frequencies are used for launch and landing operations, EVA comunications, (i.e. from the spacesuits back and forth to the shuttle), and as an additional voice downlink when other channels are in use or the current ground station has no S-Band capability. The frequncies in use are:

296.8 MHz - air to ground, or orbiter to suit
259.7 MHz - air to ground, or suit to orbiter

279.0 MHz - suit to orbiter or suit to suit
243.0 MHz - standard Mil aircraft emergency freq.

The S-Band system is one of the primary orbiter downlink bands. The voice channels are digital slope delta modulation and are mux'ed in with the rest of the orbiter telemetry, very difficult to copy. Much of the downlink TV is on S-Band also but it is wideband FM and should be easily copyable. The frequencies are:

2287.5 MHz - primary digital downlink
2250.0 MHz - wideband FM with either main engine analog telemetry during launch, or TV during orbit operations.

The Ku-Band system is used in conjunction with the tracking and data relay satellites and is used much more heavily in Spacelab flights than in others. The data is *very* high rate digital (50 Mbits/sec range) and therefore essentially impossible for you to demodulate and decommutate in your basement. Nevertheless the shuttle transmits on 15.003GHz. You should also note however that these transmissions are directed toward the TDRS satellite with a high gain antenna and would therefore not be copyable on the ground.

The UHF frequencies are fun to listen to but are not heavily used except during EVA's. You will almost always hear some activity on them however sometime during a mission but you just have to be patient.

Happy Listening!
Ron WA4SIR

305. Bridges are waveguides, not capacitors.

Newsgroup: rec.ham-radio
Date: 1990-01-15 22:21:36 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9001152221.AA02426@cmr.ncsl.nist.gov>
Source record: 14222

Dube Todd says:
Phil Ngai asked about why AM radio fades when you drive under a bridge but FM isn't affected nearly as much.

It's not so much a function of the modulation mode as it is the frequencies in use. In a way, the bridge acts like a capacitor. The longer wavelengths etc, etc, ^--Don't you mean "wave-
guide below cutoff".

Even a short length of wave-guide (bridge, tunnel, etc.) has extremely high attentuation at frequencies below its cutoff freq. The cutoff freq. is roughly that at which the inside circumference is a wavelength. ie. a guide which is 1/2 wavelength in the width but very narrow in height would be at about its cutoff frequency - or at least very roughly so.

Thus Dube's conclusions were correct, just the detailed reason was not.

Bob, W3OTC

In article <28774@amdcad.AMD.COM>, phil@pepsi.amd.com writes...
>We all know that AM broadcast radio fades when you drive under a bridge
>but FM doesn't tend to nearly as much. Why is this?

Think of it as a shielded enclosure. Shielding effectiveness varies
with the size of the opening (road, in this case) with "size"
measured in _wavelengths_ at the _frequency_ of interest. In the
case of the bridge, this makes it a good shield at 0.55-1.6MHz and a
poor one at 88-108MHz. As a useful rule of thumb, any opening with a
single dimension greater 10% of a wavelength will start to leak at
that frequency, and above...

>Does RF at the FM broadcast frequencies propagate better?
I would not have used the word "better". Each does propagates
differently. IF the 88-108MHZ signal were "off axis" to the road
opening and IF there were no random metal around to reflect it, it to
would likely fade...

>I thought the higher the frequency, the more it exhibited "line of sight"
>behavior.
I once lost the base transmissions from a nearby city police
department, while still getting the mobiles. A little mapwork showed
that a new, high level, Interstate bridge was blocking the line of
sight to the (high) base antenna. The mobiles were radiating through
the space UNDER the bridge...

>Or is it because AM shows the signal reduction more directly?
AM does show changes in signal strength more directly. Thats why there
is...

>Shouldn't AGC take care of that?
AGC, however, if the signal strength goes down too far, the AGC can't
bring it back up.

>following table:
>
>Antenna Type Effective Input Radiation
> Aperture Impedance Resistance
>
>Short Dipole ???? ??? ???
>Long Dipole ???? ??? ???
>Short g-plane qwave ???? ??? ???
Is the "qwave" the length of the driven element or the g plane?

>Long g-plane qwave ???? ??? ???
same query. My understanding is that making ground plane elements
longer than 1/4wave (radius) has no effect (after the voltage peak
at 1/4wave, the rest of the wire is "invisible...)

>Magnetic Dipole ???? ??? ???

All this, and more, is available in any good antenna engineering text
or reference (Antenna Engineering Handbook, Jasik, comes to mind.
Graphical representations are in the ARRL handbook, I forget how
many of the formulae (formulas?) they include.)

Numerical values for "short" and "long" will be needed. Off hand,
both the impedance and radiation resistance will get arbitrarily low
for "short" (measured in wavelengths) antennas, rise to a maximum for
half wave, then fall again, then rise, then...

Feed point also needs to be picked (end feed a half wave, high z,
center feed, 75ohm). (Which is just a different way of stating
the last sentence in the prvious para...)

Hopefully, somebody else can supply some program names or sources.

thanks

> Phil Ngai, phil@diablo.amd.com {uunet,decwrl,ucbvax}!amdcad!phil
> Peace through strength.

Mostly it's due to the frequency. The tunnel (or bridge) can be thought
of as a too-small waveguide - the signal is cut off. FM wavelengths are
much shorter, and the tunnel passes them.

Practically, some signal will get into the tunnel, but you receiver is
not sensitive enough to receive it, so the AGC will still not work running
wide open.

I had a friend who was a DJ for an AM station, and when he rode in my car,
you actually couldn't hear him talk when we drove under a bridge. (This
is an old joke, but I felt it applied here)

Actually, I had this as an EE problem to solve in college - how the tunnel
could be modified to pass signals of a frequency above cutoff. One way
was to modify the u (mu) of the material in the tunnel - such as a special
gas, or styrofoam, obviously impractical. The real way was to run a wire
through it which extended outside the tunnel. The wire would conduct the
RF into the tunnel and allow reception. I forget the exact details on
length of the wire, but this was in a course taught by John Kraus (Mr.
Antenna) himself, so I'm confident of the solution.

Message-ID: <9001152349.AA08141@ti.com>
Source record: 14226

How much space does WiAW take out of the entire Amateur allotment? OK, so I'll admit that if you happen to be right where they land, it seems like "too much". But other than that, I'd say that the amount of free air available at any given moment is far more than today's Hams are using; and that goes for each band.

So what's wrong with learning W1AW's schedule and trying not to be on the freq during their xmsn times? Where has the spirit of co-existence, temperance, and tolerance gone? Has it been replaced with selfish, "me-first", "gimme-mine" attitudes?

Bob West made a good point when he spoke about the widespread availability and use of code tapes and PC's; but it should not be taken as a world-wide thing. Hams and aspiring Hams are worldwide, and I'll be willing to bet that a huge majority of them can't afford the equipment (if in fact they even know of its existence). When I started out learning Morse Code, there was some very good paper-tape machines available; but there was no way I could afford one. The only way to get practice was to just sit and listen to it on the radio. W1AW was (obviously) the only station that reported sending speeds.

Let's let W1AW continue the way it has always done. It does far more good than bad.

73,
Dube Todd, N5PDK

If you find this don't be selfish with it. I have a clock at work
which does the same thing but I must set the computer's clock by
watching the wall clock. Please let me automate if I can.
I.e. post the source if you can.
Tell me where to buy the binary if I must.

>to take some thinking - maybe the requirement should be related to power
>versus bandwidth. This is ok for SS - I've heard that a SS transmitter
>requires much less power to get the signal across.

This is not true, at least not in the general case. Ignoring intentional QRM for a moment, spread spectrum does NOT reduce the transmitter power required to support a given data rate. Thermal ("white") noise looks the same before and after despreading, so there is no net benefit or loss to using spread spectrum in this case.

The advantage of spread spectrum comes when the "noise" is not white -- intentional interference, say. In this case, if the jammer doesn't know the spreading sequence you're using, then he will be forced to spread out his jamming power over your entire spreading bandwidth, while your "effective" (despread) bandwidth is much smaller. The ratio of these two bandwidths, known as the "coding gain", is the power penalty you impose on the jammer. If your coding gain is 20 dB, then the jammer will have to increase his jamming power by 20 dB to cause as much trouble as he would to an unspread signal.

Part of the confusion comes from spread spectrum's use of the term "coding gain". The same term is used in forward error correcting (FEC) schemes to denote the power that *is* saved by the use of excess bandwidth when the noise is white. FEC requires excess bandwidth because it adds redundancy to the data stream; spread spectrum requires excess bandwidth because it adds a separate pseudo random "data stream" to the signal which is removed before detection at the receiver. This random data stream (properly called a "chip sequence") contains no information per se.

I am as interested in novel, experimental modes as anyone, but I have a hard time getting excited about the widespread use of amateur spread spectrum. Its main advantages are its low probability of intercept and its resistance to jamming. Although we hams have our share of intentional QRM, these features are clearly much more important to the military. There are some other features of spread spectrum that make it useful for special applications, such as accurate satellite ranging, and I'd like to see it developed to support OSCAR operations. But as a general ham communications technique it is almost always less efficient in the use of spectrum than either frequency division multiplex (i.e., FM or SSB channelization) or time division multiplex (e.g., packet). And

there's also the "near-far" problem which greatly limits the ability of several stations to share the same frequency band when they are at different distances from each other.

Some years ago the FCC commissioned a study by MITRE on civilian uses of spread spectrum. They reached similar conclusions -- about the only situations where it made sense were these:

a) "salvage" use of "garbage" spectrum like ISM bands where communications were otherwise impossible due to QRM (note: 902-928 MHz is an ISM band).

b) transmission of low data rate signals on microwave frequencies where the guard bands required for conventional FDM channelization would result in unusually high overhead.

c) certain mobile applications where multipath was unusually severe.

I think this effect can be explained by thinking of the bridge or tunnel as a waveguide. Shorter wavelength signals, such as FM broadcast (approx. 100 MHz), will propagate through the guide assuming typical bridge or tunnel dimensions.

Longer wavelength signals, such as AM broadcast (approx. 1 MHz), are below the cutoff frequency of the guide and thus are evenescent inside the structure.

You should notice that as you enter the bridge, the longer wavelength signal begins to die out gradually (except for leakage through any large openings such as between spans).

Logarithmic A/D converters have problems of their own. In particular, the quantization noise varies with the total signal power entering the A/D converter, so you can encounter objectionable noise in a quiet part of the band as a result of a strong nearby signal. There's no getting around the requirement for lots of bits/sample if you want a large instantaneous dynamic range, i.e., the ability to pick a small signal out of a collection of more powerful simultaneous signals.

Some years ago, my boss built a set of experimental Ethernet packet telephones. They used standard AT&T 8-bit mu-law PCM encoding, which is logarithmic. The software in the phones generated all the usual call progress tones for the user's benefit, including dial tone. Dave couldn't figure out why his dial tone sounded slightly "fuzzy" in comparison with the "clean" sounding tone on our regular office phones.

It turned out that the "fuzzy" tone was completely normal for dial tone run through mu-law PCM; this was confirmed by calling up a remote PBX on a regular phone using a trunk that was almost certainly T1. The audible "fuzz" was simply the quantizing noise floor that had been raised by the presence of the dial tone. It was audible because it covered the entire voice band, not just the frequencies occupied by the dial tone components. It is not audible on regular voice because it is pretty much "covered up" by the (wider) voice frequency components.

If the sampling technique were linear, the quantizing noise level would have been independent of the input signal level. On the other hand, with only 8 bits of precision, this noise level would be objectionably high on quiet voices. Logarithmic techniques can sound subjectively better in certain cases like telephone speech, but they do not give you something for nothing. It's a bit like how NTSC gives you three video "channels" (RGB) in the space of one; it plays some sleight of hand with human perception.

In the case of a DSP radio, linear sampling would be much more effective. The samples have to be linear to be processed anyway.

No! Don't do this! Power line noise is usually caused by loose hardware
up on the pole, and who knows what might happen if you shake it up. I've
heard stories of transformers falling to the ground after somebody hit
the pole with a sledgehammer.

>the more it exhibited "line of sight" behavior. Or is it because AM
>shows the signal reduction more directly? Shouldn't AGC take care of
>that?

I might as well take a stab at this one.

The reason has to do with the relative wavelengths of the two signals;
the modulation method isn't nearly as important. Standard AM broadcast
signals have much longer wavelengths than FM. AM signals are "large"
relative to the dimensions of a bridge, while FM signals are "small".

Radio waves have trouble propagating through small (relative to their
wavelength) windows in conducting material. That's why you can easily
see into your operating microwave oven without frying your eyeballs. The
holes in the metal screen in the door are very large compared to the
optical wavelengths you see with, but they're very small compared to the
wavelength used for cooking.

I've noticed that you can see a difference when driving even between
signals at the opposite ends of the AM broadcast band. Stations at the
top end aren't nearly as affected by driving under a bridge as stations
at the low end. (Note that the AM broadcast band covers almost a 3:1
range in frequency and wavelength.)

From: alanb@hpnmdla.HP.COM
Message-ID: <1250115@hpnmdla.HP.COM>
Source record: 14130

Theoretically, an ATV exciter should be followed by a truly linear amplifier. Since linear amps are less efficient than class C, this would argue for using an unmodulated exciter and modulating the PA.

However I think linearity is less important with ATV than other AM modes. The signal is ALREADY wideband, so you don't have to worry (within reason) about splatter. The main effect is to alter the gray scale (contrast and brightness), which can be adjusted for in the modulator.

Source record: 14219

Well, I'm on my *second* one so far, myself...

I bought one of these this past Thursday - it was working fine until Sunday evening, when I noticed all of a sudden that the unit's RECORD button would not stay locked down when pressed (real useful, you know? 8)) So I took it back yesterday and exchanged it for another one, which seems to be doing OK so far (I hope it stays that way!)

Overall I like it alot; I, too, have been using it with my scanner at home. For what it's worth my experience so far with it is summarized below:

I have a Uniden/Bearcat 210XLT feeding the CTR-82's AUX input from the 210's EXT SP jack. Audio quality is quite good. I've also noticed (as someone else had mentioned here) that when using an AC power source (I have the 'Shack' AC adapter, too) I've noticed the 'RECORD/BATTERY' LED seems to "flutter" when the unit stops in VOX mode; mine only seems to do it when the VOX is set to HIGH sensitivity. The recorded audio doesn't seem to be affected by it. I tried using the MIC input instead of AUX (by accident) - AUX definitely worked better (better audio and alot less background "hum" from the AC).
Also, I tried using LOW sensitivity on it - it worked, but I had to turn the volume up higher to trigger the VOX, which made me wonder if a low-audio signal coming through would trip it, so I think I'll keep it on HIGH sens.
Finally, I've also noticed some AC "hum" when using the adaptor... again, it doesn't seem to affect the quality of the recording very much (if any).

All in all a nice machine, I think... if this one lives more than 3 days...

I am interested in receiving the journals produced by the amateur radio societies from other English speaking countries (their versions of QST). Does anyone out there have any info on this? The address of RSGB is pretty easy to come by, but I don't recall ever seeing anything for Australia or New Zealand. Canada must surely have a ham rag or two. The 'English speaking' requirement is due to my lack of ability to read other languages. It would be wonderful if translations were available for journals in other languages, but that might be asking too much.

For any given society, must you be a member of that society to receive the journal?

A (loosely) related question - anyone have any info on obtaining metric sized envelopes for QSL'ing purposes? I'm thrilled when I get a DX QSL back, whatever the shape its in, but it would be nice if the sender didn't have to fold it to fit into my sase.

73's - WA5RPF

325. Pure LO signals and Mixers?

Newsgroup: rec.ham-radio
Date: 1990-01-16 14:33:18 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <16.Jan.90.14
Source record: 14220

I cannot help thinking that much of the current problem with reciprocal mixing of LO noise sidebands is related to poor mixer/frontend design. Admittedly, the oscillator that produces no noise sidebands just does not exist in a form that would be usable in a radio, but having looked at many of the modern rigs, mixer stages clearly are not an area that makes advertising-hype sense. The usage of dual-gate FETs, often in single-ended, unbalanced configurations, seems commonplace. Double-balanced hot-carrier-diode mixers are few and far between. A properly designed mixer should need no RF amplification ahead of it (well, not for the HF bands anyway) and be able to handle VOLTS of input without any harmful overload effects. Conversion gain is the last thing you should expect in a mixer. From the first mixer, you should feed the signal straight into the main selectivity-providing filter without further amplification, so that all the unwanted signals are taken out as soon as possible. *Gain before the filter is the last thing you want* Why oh why do manufacturers have multiple conversions, with the main receiver selectivity provided only after the signals have crossmodulated their way through about 5 or 6 stages of amplification and mixing. If you have 50dB gain before the filter, how can you expect to avoid crossmod?
Anyone remember the RCA 7360 beam-deflection mixer? Low noise, masses of signal-handling capacity, and balanced LO drive. First time i tried one, it could not be balanced - then i discovered it was rather close to the magnetic field from the mains transformer. A permalloy shield between tube and transformer resulted in instant mixing Nirvana! Low noise and linearity in one package. Who could wish for more?

Re: W1AW schedule

I've thought about this a little more since my last posting which,
like Dube's, asked for tolerance for W1AW's activities.

Some clarification is in order.

W1AW transmits the following items (last time I checked):

Code Practice
ARRL Bulletins via code(supposedly of interest to all hams)
ARRL Bulletins via RTTY
ARRL Bulletins via voice

more? (packet bulletins?)

If this entire package is what is being discussed and some folks object
to, I am in more agreement than I first thought.

This is a helluva lot of redundancy and band occupation.

I heartily support the Code Practice sessions because of the utility
of learning code for beginners and upgrades.
I am not so supportive of the bulletin operations. I think fewer times
and frequencies and, perhaps, fewer modes would accomplish the same
purpose.

I think I'll check into this and write ARRL a letter.

>rules specifically mentions this sort of modem as being legal and appropriate
>for narrow-band use.

No modem I know of uses a speed of more than 2400 baud (simplex).
Modems like the ones used in faxes use a combination of amplitude and
phase modulation to send 5 bits at once. One bit is used for forward error
correction (fax does not use ARQ) using a so-called "Trellis code".
So you get 4 bits a once. With 2400 baud you get 9600 bits/second.
A similar scheme would using the 300 baud limitation would give you
2400 bits/second for packet radio. More sophisticated schemes are known,
designed for satellite or military communication. If special coding techniques
are used (you need complex circuits for those!) you can get very reliable
transmission without needing ARQ (imagine ARQ with a Voyager probe).
Too expensive for mere mortals? I don't know, a DSP like the Motorola 56000
might be able to do most of the work, as the baud rate is limited to 300 anyway.
It might even be cheap compared to a state-of-the-art transceiver.

>are pushed off the air because they cannot get an American FM license, and I
>would bet that some college radio station would love to take to the airwaves
>internationally (the quality would probably be better than carrier current!)

Most US stations on short wave (specifically excluding Voice Of America,
a propaganda transmitter for the US governement) peddle religion, not rock
music. And as rock music is inspired by the devil.....

>Also, what are the implications of licensing a commercial station to rebroadcast
>its signal over shortwave? If WFNX in boston did this, I'd buy a shortwave
>radio tomorrow!!!!!

The implications are worsening the current overcrowding of broadcast bands
by adding canned music broadcasters. I know of just a few really commercial
SW broadcasters (Radio Luxemburg e.g.) but usually there is no point
to broadcast the same music you hear everywhere on SW.

I think that fiber is too lossy to effectively transfer sunlight,
but I do remember something in popular science about Light Pipes,
these are supposed tor transfer light with something on the order of
over 99%. The work by the fact that the pipe is hollow, and the
outer edge is prismed, which makes it very good for large amounts
of light transfer, I understand it is a bit expensive, but
not out of reach of the experimenter.
I will look and see if I can find the company name.
Anmar

CURRENT LAUNCH DATE 21 JANUARY UTC

HR AMSAT NEWS SERVICE BULLETIN 015.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 15, 1990
MICROSAT - UOSAT LAUNCH SET, AGAIN

Arianespace announced January 12 that the launch of V35 is now set
for January 21, 1990 at 01:35 UTC. Note that this launch time is
Saturday evening in the U. S. The payload composite was returned
to the launcher on Monday, January 15th.

Arianespace has made special provisions for the MICROSATs and UoSATs
so that they don't have to go through another 21.5 hour period without
battery charging as they did during the first transfer. This time,
they expect to be off for a maximum of 16 hours.

The replacement tape recorder for SPOT-2 was installed January 11, and
the SPOT people were pleased\Q!the functional testing. More
importantly, NOTHING DROPPED ON THE MICROSATs or UoSATs during this
critical repair operation. The work on SPOT is now finished, and the
protective covers have been removed from our satellites once again.

AMSAT LAUNCH INFORMATION NETWORK

HR AMSAT NEWS SERVICE BULLETIN 015.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 15, 1990
TO ALL RADIO AMATEURS BT

Over 35 repeater groups around the U. S. and around the world are
planning to carry the Ariane V-35 launch live this Saturday evening
(21 January 90 at 0135 UTC). Assuming a nominal sequence of events,
transmissions will begin at 0100 UTC and end at 0230 UTC.

Reservations on the telephone bridge providing ALINS audio are
now closed. Those who have registered will be contacted two or
three days before launch with appropriate information.

The following stations will be carrying the event on HF:

Call Location Frequency Beaming

W1AW Connecticut phone bulletin USA
frequencies,
see QST

WA3NAN GSFC, Maryland 14.295 Europe
3.860, 7.185

W5RRR JSC, Texas 14.280 Central, South America,
3.840 and Caribbean

W6VIO JPL, California 21.280 New Zealand / Australia
3.850

ZS6SAT, South Africa 3.718, 7.080, 14.282 (SSB)
3.665, 7.094 (AM)

WA0RCR, Central USA 1.860 Central USA and Canada

In addition, an uplink to AO-13 (over Asia) will be provided by I2KBD near Milan, Italy, and an uplink to AO-10 (over Africa) will be provided by ZS6SAT. Operations downlink frequencies of 435.970 and 145.950 will be used on these satellites.

JANUARY 21 LAUNCH MICROSAT KEPLERIAN ELEMENT SET

HR AMSAT NEWS SERVICE BULLETIN 015.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 15, 1990
TO ALL RADIO AMATEURS BT

SPOT-2 / MICROSAT / UOSAT KEPLERIAN ELEMENT SET

If the SPOT-2/Microsat/UoSat launch occurs on 21 January 90, the following element set may be used to estimate satellite positions for the first few days. Nominal launch is expected to be around 013545 UTC.

If the launch occurs on another day, simply add 0.98561226 degrees of RAAN per day to the listed value.

Following deployment, all seven satellites will be in close proximity for several days. By the end of the first week, users with high gain antennas will begin to find the cumulative position differences per satellite growing large enough to cause significant pointing errors. All users will begin to notice the changes in AOS and LOS time.

Element sets resulting from on-orbit measurements will be provided ASAP shortly after launch and for the first several days when possible until data from the standard sources becomes available.

Satellite: SPOT-2, UO-D, E, Microsat-A, B, C, D
Catalog number: not yet assigned
Epoch time: 90021.0816319
Element set: pre-launch
Inclination: 98.738 deg
RA of node: 96.9702 deg
Eccentricity: 0.00134
Arg of perigee: 110.95 deg
Mean anomaly: 297.18 deg
Mean motion 14.1988896 rev/day
Decay rate: 1.0e-06 rev/day^2
Epoch rev: 0

MICROSAT AND UOSAT FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 015.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 15, 1990
TO ALL RADIO AMATEURS BT

MICROSAT AND UOSAT FREQUENCIES AND DEPLOYMENT ORDER

The following are the Microsat and UoSat listening frequencies,
data rates, and modes for the first few weeks of operation and
check out. Other frequencies and modes are available on each
satellite, but these are not expected to be employed initially.
The OSCAR numbers listed are, of course, tentative and assume
a succesful launch ahead of FO-1B. Please note updates and
corrections from previously released data.

Spacecraft OSCAR number Frequency, MHz Mode

UoSat D UO-14 435.070 1200 bps AFSK (FM)
UoSAT E UO-15 435.120 1200 bps AFSK (FM)
PACSAT AO-16 437.025 1200 bps PSK AX.25
DOVE AO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT AO-18 437.075 1200 bps PSK AX.25
LUSAT AO-19 437.150 1200 bps PSK AX.25
LUSAT - CW LUSAT 437.125 12 WPM CW telemetry

Packet transmission from DOVE may be monitored with an unmodified
TNC-2 or clone, using an FM receiver. The other microsats
(PACSAT, WEBERSAT, and LUSAT) require an SSB receiver and TNC
with a 1200 bps PSK demodulator (FO-12 compatible, NOT the 400
bps PSK demodulator used with AO-10 and AO-13).

MICROSAT LAUNCH TIMELINE

HR AMSAT NEWS SERVICE BULLETIN 015.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Field Operations Jack Crabtree, AA0P, recently obtained the following preliminary launch sequence timeline from Dave Cowdin, WD0HHU, AMSAT's man on the scene in Kourou, French Guiana. This schedule should be followed, at least approximately, regardless of the time and day of launch. All times are Mission Elapsed Time.

00:00 Ignition (Time is minutes:seconds)
00:04 Launch vehicle clears gantry
02:34 1st stage fuel expended
02:39 1st stage separation
02:42 2nd stage ignition
03:40 Fairing separation
04:48 2nd stage fuel expended
04:48 2nd stage separation
04:53 3rd stage ignition
16:44 3rd stage fuel expended
16:49 3rd stage separation
17:06 SPOT II separation
20:06 UOSAT D separation
20:07 UOSAT E separation
21:01 Pacsat separation
21:02 DOVE separation
21:03 WEBERSAT separation
21:04 LUSAT separation

Dave reminds us that with this configuration of the Ariane IV, there are no solid or liquid strap-on boosters. He also reports that there was a surprising amount of room left in the payload fairing in spite of the seven spacecraft mounted in it. It was necessary to add 800 pounds of lead ballast because of excess lift capability.

```
Here's the source for nbs_time.c that I scarfed from archive@mgse. I'm
posting the source, rather than the binary+source, because by the time I
wake up tomorrow morning, it'll probably have been ported to the Amiga, the
PC, the Mac, and VMS, not to mention MVS, TSO, VM, and a host of others :-)

Enjoy!

ulong to2;
int raw_flag;
char *buffer;
int bufsize;
int count;
```

```
} LRWT;

to1 and to2 are unsigned long values in milliseconds (not
currently supported well under BSD4); to1 is the time to wait
for the first character, to2 the time to wait for subsequent
characters.

if raw_flag 0, non-printables are stripped from beginning
and end of received characters (i.e., modem
response reads); NULs discarded, parity stripped
if raw_flag 1, full raw read buffer returned
if raw_flag 2, full buffer, NULs discarded, parity stripped

buffer is address to read chars into

bufsize is buffer max size (allowing room for terminating null)
which should be at least 2 if raw_size includes 0x80 bit,
else at least 12 characters if 0x80 omitted.

count is a int which, at return, receives the actual count read

334. IC-2N mod?

Newsgroup: rec.ham-radio
Date: 1990-01-16 19:24:16 UTC
From: john@ispace.UUCP
Message-ID: <102@ispace.UUCP>
Source record: 14132

I'm looking for the mod to allow the IC-2N HT to work in the
146-148 Mhz range (it's sold in Japan for use on 144-146)

de john@ispace.UUCP (ka1tb)

335. Re: Theoritical Equations for Antennas

Newsgroup: rec.ham-radio
Date: 1990-01-16 19:41:18 UTC
From: dalyb@godzilla.UUCP
Message-ID: <481303aa.1423f@godzilla.UUCP>

Cross-posted to: rec.ham-radio,sci.electronics

Subject: Re: Need Theoritical Antenna Info
Newsgroups: rec.ham-radio,sci.electronics
Keywords: Antennas

John Moore (NJ7E) posted a request for information on theoritical formulas
for effective aperture, input impedance, and radiation resistance for short/
long dipoles, short and long quarter wave ground planes, and magnetic dipole
antennas. Here's a brief summary of equations:

Reference: Balanis, "Antenna Theory: Analysis and Design", Harper and Row.
This text is available from the Arizona State University
bookstore.

Kraus, "Antennas", McGraw Hill

Short Dipole: (wavelength/50) <= length <= (wavelength/10)

Effective Aperture Ae = 3(wavelength)**2 / (8 * pi)

Radiation Resistance: Rr = (20 * pi**2) * (length/wavelength)

Input Impedance: For a small dipole of length l and wire radius a:

Reactance: Xin = -120 [ln(l/a)-1] / tan(kl)

where k = (2 * pi) / wavelength

Resistance: Rin = Rr as given above

Note that if the antenna length is slightly less than 1/2 wavelength,
the reactance will go to zero. For l of a halfwavelength, the reactance
is approximately zero and the resistance is close to 50 ohms. (42.5 ohms
for wire of small radius).

Long Dipole:

The analysis for a finite length dipole gets a little complicated.
Balanis (reference above) provides a FORTRAN program in his text
to compute radiation resistance, directivity, and input resistance
for a finite length dipole based on the following equations:

Radiation resistance Rr = 60 { C + ln(kl) - Ci(kl) + (1/2)sin(kl)

* [Si(2kl) - 2Si(kl)] + (1/2)cos(kl)

* [C + ln(kl/2) + Ci(2kl) - 2Ci(kl)] }

where Ci,Si are cosine and sine integrals
C = Euler's constant = 0.5772

Input resistance: Rin = Rr / (sin (kl/2) **2)

Input reactance: Xin = Xm / (sin(kl/2) **2)

where Xm = 30 { 2Si(kl) + cos(kl)[2Si(kl) - Si(2kl)]
- sin(kl)[2Ci(kl) - Ci(2kl) - Ci((2k * {a**2})/l)]}

Effective Aperture (maximum):

Aem = {(wavelength **2) / (4 * pi)} * (directivity)

Balanis figure 4.8 plots directivity versus dipole length for
0 to 3 wavelengths. The calculation for the directivity is
rather complicated; refer to the reference for details of the
calculations.

Magnetic Dipole:

By applying the principle of duality, a magnetic dipole of magnetic
moment Iml is equivalent to a small electrical loop of radius a and
constant electric current Io provided that:

Iml = jSwuIo where S = area of the loop = pi * a**2
w = radian frequency
u = permeability

For a small electric loop of radius a:

Radiation resistance: Rr = 20 * (pi)**2 * {C/wavelength}**4
where C = circumference of the loop

Effective Aperture (maximum) Aem = 3 * (wavelength)**2 / (8 * pi)

Short/Long (what is a short or long??) Quarter Wave Ground Plane:

The analysis of a quarter wave ground plane antenna is essentially
a vertical electrical dipole above a ground plane.

When the length of the antenna is a quarter wave, and the height above
the ground plane is zero, then:

Input impedance = 36.5 + j21.25 (note that this is one half the input
impedance of a half wave dipole)

Effective aperture (maximum) Aem = 0.13 * (wavelength)**2

I hope this helps answer some of your questions. I refer you to the
references I mentioned for more detailed information. The Balanis
text does contain many FORTRAN programs, which may be of some use.

+
+There is also a fair amount of use of converted AM CB sets on ten meters,
+this is partly because many of the 'UK spec.' CB sets (FM) are quite hard
+to pull onto 28MHz (they use the SANYO LC7137 PLL chip, which has the
+division ratios mask-programmed in). Converted CB sets (AM, FM, multimode)
+seem quite popular on 28MHz. If only they were all used by licensed hams, it
+would make things better. We have a serious 'pirate' problem around the
+bottom end of ten meters.
+
Well..it looks to me like the problem is spreading..10 meters is supposed to be an exclusive, worldwide Amateur band. Here in the states, the pirates tend to be mostly Hispanics and a fair number of illegals, handling traffic into and out of Mexico and S.America. Sigh. Does the UK (or anyone else?) have a CB band between 26 and 28 MHz.? I wonder about this because of the ever increasing number of 'world market' or 'export-only' CB's that are showing up here. 90% of these rigs are multimode (AM-FM-SSB, some with CW!) and seem to cover, variously, the 26-28.3 or 30 MHz area. What excuse exists for building these damn things is beyond me..the manufacturers seem hell-bent to create products for the bootleggers..I say the FCC/ITU should clampdown on them..make them build CB gear that CANNOT be modified to operate above 27.995, this *might* slow the bastards down a little. Grrrr!

Anybody got an anti-acid? ;-)

Well, I've been wondering recently, what with spread spectrum and all,
how hard it would be to make a spread spectrum IF. Yep, you read right,
a spread spectrum IF. THAT would be hard to detect, I bet. Also
pretty hard to build, but I'll bet SOMEONE on the net can get around
the problem....

One such source is DX QSL Associates at 434 Blair Road NW, Vienna VA 22180.
They sell (mint) foreign stamps, and various other stuff that might be of
help in getting QSL cards from overseas. They sell 11x16 cm "European- sized"
airmail envelopes for 25c each. I'd suggest sending a SASE and asking for
more details. Some of the other stamp services might be able to help too.

[Thanks to Patty Winter N6BIS for remembering that the above info was in a
recent DX Magazine (Jan 90 issue).]

Hi netlanders!

I have the following HAM gear forsale:

ICOM 27A 2 meter transceiver - $250
25W out, PLL synth tuning
VFO A & B, 10 memories,
PL tones with DTMF mic.

The rig is in excellent shape. Manual included.

Will throw in a Telex 5 element 2 meter beam
that has never been out of the box.

Spectrum SCR 2000 X 440 Mhz repeater - $850
This is a great deal! A working full featured
repeater complete with duplexers, and a BRAND NEW...
(*READ NEVER OUT OF THE BOX*). Hustler G6-440 base
antenna. Repeater features touch-tone remote programming
of various features, 40W output, auto-patch, 110V power supply,
terminals for 12V backup power, 8 aux inputs (for patching
to other repeaters, westlink, etc). I also have
manuals that describe in detail the transmitter, receiver,
duplexer, and control circuitry.

NOTE!!! this repeater has the callsign of the original
owner - W7SRZ - burned into the CPU along with the
access codes. You can turn the CW ID volume completely
down and patch in your own CW IDer very easily. Spectrum
no longer makes the CPUs.

I have tested the repeater to see if it would handle
packet transmissions and it will.

The prices on both of these are firm but I do have to move both
pieces of equipment rapidly. I will pay shipping within
the continental US based on the prices above.

> about splatter. The main effect is to alter the gray scale (contrast and
> brightness), which can be adjusted for in the modulator.
>
> Al N1AL

ATV is ALREADY wideband, that's for sure. What is needed is Vestigial
Side Band which is what the broadcasters already use to keep their signal
within 6 Mhz (carrier +1.25 Mhz from the bottom).

However, non-linearity in the amplification of a VSB ATV signal can reintroduce
the removed sideband (and maybe some harmonics and wider splatter as well) and
prevent the ATV signal from being as narrow as it can be.

With increasing pressure on our spectrum due to the probably loss of 220-222
Mhz, the increasing use of AVM systems on 902-928 Mhz, and many other things,
all uses of the spectrum need to consider their efficiency so we can operate
things with closer frequency spacing. ATV users need to seriously take a
close look at VSB to help fit in better, especially in the complexly tight
70cm band. VSB is absolutely needed in some cases. For instance ATV
repeaters (as well as ANY repeater) may NOT operate on 431-433 or 435-438
Mhz (FCC rules). That means an ATV repeater with output at 439.25 Mhz *MUST*
use VSB to be legal.

Kudos to AEA for putting VSB in their new ATV transmitter (but can someone
tell me how well it really works?).

(this should probably be dragged over to rec.radio.shortwave, or rec.railroad
8)>>)

The two systems i know of involve:
Using wilfully leaky coax. An open weave braid allows noticeable
amounts of signal out, and in. Some amplifiers and mixers and away
you go...

A system in NY City, allows the police to take their standard HT's
into subway stations, while staying on the same channel. They found
there was enough loss between topside and underground that they could
equip each station with an above ground antenna, directional couplers,
amplifiers, antenna(s) below ground. The loss "down the stairs"
was enough to keep the underground transmitter from getting into
the above ground receiver on the same frequency, and vice-versa...

I am going to build a PLL based Subsidary Carrier Authorization (SCA)
detector based on the NE565 PLL. When I went to buy the IC, all
the dealer had was an LM565CN. I don't have, and haven't been able
to find, the data sheet for this chip. Could someone look it up
and tell me if it has the same pinouts as the NE565?

Thanks
Jim Malcolm
...!att!whuts!jim

PS. I plan on using the circuit that appears in the Radio Amateurs
Handbook (Chapter 18 in the latest version). The alternative is
the circuit in the Signetics data book. Has anybody built and
used either of these circuits?

345. Your chance to help spend someone else's tax refund!!

Newsgroup: rec.ham-radio
Date: 1990-01-17 05:16:29 UTC

BEFORE I START: Thanks to Gordon Vickers for the frequencies.
To the person I promised a copy of the SX62 manual, Brian, I am still working on it. To Ralph Brandi, Was that what you wanted for an r.r.sw intro?

Okay, on with the REAL topic....

Well.... If all goes well this year I will get a small tax refund. Being that I have not treated myself to something *expensive* in the last several years, I am considering buying myself a scanner.

I will be happy with a tabletop model as long as I can keep the cost as far under 500 dollars as possible. I have already read Bob Parnass' review of the Realistic PRO 2005 and his used scanner selection article. (Both very well written documents by the way.) If this comes to pass I want to make certain that I spend my hard earned money wisely as this will probably be the last radio I will be able to afford for quite some time. (Getting married drains the budget, so I hear. Not to mention my fiancee seems to think we are going to need useless luxuries like sofas and refrigerators more than we will need necessities like a radio to listen in to the neighbors baby monitor or the city street sweeper. :-)

Would you like to help me with my plight? I need to find a scanner that meets the following criteria:

1) Continuous Coverage or as close as possible, from 30 mcs up to AT LEAST 950 megs or so.
2) Ability to operate in all covered bands in AM, and FM mode. SSB would also be nice, but I expect it would get too expensive.
3) LOTS of memory available. Certainly 100 frequencies or more is not too much to expect.
4) A good search capacity allowing for variable search increments. ie: 12.5 khs 5 khz etc.

In addition The following features would be considered a great plus:

1) More than one antenna jack.
2) A (good quality) backlight.
3) The ability to run off of 12 volts. (For automobile use.)
4) An S-meter.
5) A built in recording jack.
6) A built in clock/timer.
7) A built in micro-wave oven. (so I don't have to get up all the time :-)
8) Anything else you reccomend?

So far I am considering the Realistic 2005, however,except for one
well known poster, I have heard nothing first hand from people who own
one. I want to know what quirks you have found to be annoying or whether
or not you would buy one again. Also any other comments you might have.

I have heard good things about the Realistic 2004 as well. Has
anyone out there contrasted the 2004 and 2005? Which is better for you
which does more after the standard modifications have been made?

Are there any other scanners available (That are not made by
AOR -- heard too many bad things about them) that fit the first several
criteria I mentioned? Is there anything upcomming for release in 1990
that would be better to wait for?

Along a different vein:

I am going to want to purchase a good listening antenna for
whatever scanner I choose. It will have to be compatable with
frequencies from 50 to 900 or so and will have to be omni-directional
for standard reception. Any choices available? I know painfully little
about this as I have been using Radio Shack's (ugh theres that word
again), bottom of the line for about 4 years now.
What will this run $$$?

Lastly, what is the best cable for an application such as the
one I have described above? I know that good quality RG8U is the best
for the bucks for shortwave, how about for VHF UHF and borederline
microwave?

Any help on any of these subjects would be appreciated.

I just posted to alt.sources cmostime3, a two-part shar, which was an expansion on my previous program, nbs_time.c. The whole business was inspired by comp.sources.misc v03i079. The original author did all the hard work. For nbs_time.c, I just put a bunch of async junk around it to autodial and otherwise make it a standalone program. cmostime built on this to avoid using the inexact /etc/setclock and a few other goodies.

v03i079 contains a GREAT program utc.c which allows your system to mimic NBS and provide esentially the same service via a local call. Only the most ultimate time freaks who've replaced their PC's crystal with an atomic clock can tell the difference (I'm pretty bad, but not that bad) :-).

>Clark, WA3JPG

For a repeater, it is a series of filters that go between the antenna,
the receiver, and the transmitter. The filters between the transmitter
and the antenna are tuned to the transmitter frequency (bandpass) or
tuned to reject the receiver (bandstop); vice-versa for the filters
between the receiver and the antenna.

For the dual band radios and/or the dual band antennas, just filters to
make sure the RF goes where it is supposed to go. I'm sure you can
figure it out for your particular configuration.

350. Radio in tunnels?

Newsgroup: rec.ham-radio
Date: 1990-01-17 09:48:00 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <17.Jan.90.09
Source record: 14151

One reason you can receive FM better in tunnels/bridges is that in some instances, there is provision made for radiating the FM signal INSIDE the tunnel. Special 'leaky feeder' (typically a length of Andrew 'RADIAX') is run along the tunnel. Slots are cut in the screening, to allow the signal inside to 'leak out' in a controlled fashion. Signals are fed into the coax from an external antenna. The coax acts as a long, lossy feeder. This can, of course, work in both directions - construction crews etc. can transmit back to their 'base' by pickup on the leaky feeder and reradiation back down the tunnel.
The same practice is used in mines where the ground conductivity is high - they use a network of cross-connected leaky feeders, sometimes with amplifiers between 'domains'. Watching somebody talking to his crew (who are a couple of miles underground) on a handheld, is somewhat surreal!
I am also told that there are FM radio stations that broadcast specifically to people in tunnels....?
++Pete

351. Miniature FM receivers - what chips to use?

Newsgroup: rec.ham-radio
Date: 1990-01-17 12:19:21 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <17.Jan.90.12
Source record: 14152

Somebody was wanting any info on miniature FM receivers. I dug out some relevant info last night. Look up the Mullard/Philips/Signetics NE602 and NE604 chips (602 is RF frontend, 604 is FM IF subsystem). If you have access to a local friendly Signetics/Mullard semiconductor stockist, ask for the following application notes::

'Product specification SA/NE604 Low-power FM IF system (12 pages)'

'Application note AN199 - Designing with SA/NE604'

'Application note AN198 - SA/NE602 double balanced mixer/oscillator'

'Designing with the NE/SA602 Application note AN1982'

NE602 is a fun chip - balanced mixer to 500MHz, oscillator to 200MHz, 18dB conversion gain at 45MHz, total current consumption 2.4mA at 6 volts. It is not exactly 'state of the art' as far as mixing is concerned, but it is far cheaper than Plessey SL600-series chips (and smaller and uses less power...) It comes in an 8-pin DIP outline.
NE604 is the IF processing chip: 2 limiting amplifiers, quadrature FM detector, muting, logarithmic signal-strength indicator and voltage regulator all in one 16-pin DIP. It was originally designed for cellular phones.

Just about any stationery (or is that stationary?) store will have what
they call European Air Mail envelopes. If you buy an entire box of 120,
they will cost about 15 cents each or so. If they'll sell you a little package
of 10, they'll probably cost 25 cents each. They are blue with red trim,
and AIR MAIL and AIREAU MAILEAU, or however you say Air Mail in French,
(I think it is actually Par Avion) is imprinted on the envelope.

I started using these a number of years ago when I noticed that the business
size SASEs I sent to DX stations were either not coming back, or were coming
back folded or cut and taped. It turns out that our business size envelopes
cost more for furreners to air mail than their "metric" size. I would estimate
that 3 out of 10 of my business size SASEs were used by the DX station,
and 7 out of 10 of the European Size Air Mail envelopes come back.

By the way, if you still want to use the standard Amurrican size business
envelopes as SASEs, make sure you get some of those little Air Mail stickers
(the Post Office will give them to you free) and place them on there. If
you don't and the DX station doesn't, the return will go via surface mail,
usuallly dragged behind a yak until it reaches France or England where it
is dragged behind a small truck.

>a waveguide. Shorter wavelength signals, such as FM broadcast (approx. 100 MHz)
>will propagate through the guide assuming typical bridge or tunnel dimensions.
>
>de WB9MVP, Tim

I have also attributed this phenomenon to waveguide effect. Another reason
I assumed this is because I noticed that the signal level of the FM station
does not stay constant. It increases and decreases as you drive thru the
tunnel. Most people probably don't notice this as they drive thru the tunnels
at a pretty good clip and it is not as noticable on strong local stations as
it is on fringe area stations. I haven't actually measured the distance, but
my guess is that the peaks in signal level are located at some multiples of
the wave length of the signal.
This is based on a lot of "research . :-) I drove thru this small tunnel on
my way to work every day for about 5 years.

>radio tomorrow!!!!!

WRNO in New Orleans, LA answers both of the above questions. I don't know
what the definition of Classic Rock is anymore, but they play hard drugs
rock and roll (I'm into folk music, so there is a lot of stuff that sounds
like HDRR to me). They used to just simulcast their FM station but I believe
they may now have seperate programming. They used to have a strapping signal
on something like 7455 here in the evenings.

THere also used to be a station KYOI on Saipan that used to broadcast rocka
nd roll into Japan, and was audible here. Radio Australia used to have some
good Amurrican music programs. In fact, Radio Australia alone would be enough
to justify buying a SW receiver.

My all band xcvr was stolen a few years ago and I'm not current on the SWBC
bands anymore. Bob Horvitz is on here, I think, and is a good source
for what is still on the air. By the way, its not a popular stance, but
I used to do a lot of overseas travel and found VOA to be one of the best
SW stations around, after the BBC. They had a pretty good "Good Morning,
America" kind of show and good newscasts. I think their political slant
is less distorted than a lot of people like to make out. Most people seem
to start calling VOA a "propaganda" station once they find out that VOA's
policy is not to send QSLs or program quides to U.S. listeners. I think
that is a pretty good policy, myself.

I've built the Signetics one. It works, but unless you live in NYC
or somewhere similar, you'll only find a few stations running SCA and
most of them really aren't very intersting...

Also, you need to get into the pre-decode audio in your FM reciever,
which may or may not be easy...unless you have a truely ancient reciever
with a composite out jack...

When I go through the Holland tunnel under the Hudson River, I notice
that VHF FM broadcast signals fade out to below the noise threshold about 100 meters in.
The Signal reappears twice during the mile long travel when you
pass by the escape tunnels going up to shoreline. This seems to be an exception to the
explanations previously posted on the net.

Any ideas why? The Holland tunnel entrances are at 90 degree bends to the axis of the
tunnel and it is about a mile long under water. Diameter of the tubes is
about 10 meters.

Don't forget the English language edition of "VHF Engineering" an
excellent technical magazine from Germany. It's like Ham Radio
used to be about 10 years ago before it got watered down. It is
available in this country thru Timekit, which also sells kits
for many of the construction articles appearing in VHF Engineering.

I think this statement is a bit mixed up. The resistance is
going to be more like 72 ohms.

For an electrical 1/2 wavelength the reactance will be 42.5 ohms and the
resistance will be 73 ohms.

>

>
As I noted above for a halfwave, your parenthetic comment now agrees
with the halfwave case. Again, if the monopole is slightly less than
an electrical 1/4 wavelength the reactance will go to zero.

BTW, I think most of these cases assume the current loop
location, e.g. for the half wave dipole we are looking at the
impedance at the dipole's center. If we were looking at the
current node the impedance would be quite different.

>Mailer: Elm [revision: 64.9]

I'm looking for the European version of crystal X3 in the Kenwood TW4000A transceiver. I have an American spec version, which transmits on 440-450 Mhz, and need to get the European crystal to switch to 430-440 Mhz. The frequency is 32.8something rather than 33.something Mhz. I have tried ordering one from Kenwood, but that was six months ago. Anyone HAVE one they'd be willing to part with (having moved a radio from Europe to the States), or know of a reasonably good source?

Message-ID: <9001171127.aa10870@crdec3.apgea.army.mil>

Saw your posting in INFO-HAMS. A slinky antenna was available several
years ago for about $70. It consisted of two slinkies (Helical coiled
steel wire) with a coaxial balun. Probably cost all of $5.00 to make.
I have the same problem- need an indoor antenna. I posted the use of a
slinky vertical on the net which I saw in 73 magazine a few back.

Go to a toy store and get a large slinky (about $3.50 for the metal
variety. Elongate it vertical over a 1x3, a dowel, etc., to about 6
feet. Tack it in place and feed it from a tuner as if it were a long
wire. I live in MD and the first station I worked was CA while sitting
in my bedroom (20 m on a Saturday) using about 50 watts. You can try feeding it
with coax, with the braid going to a quasi radial system in your attic.

I have also built a dipole using two slinkies and fed each side directly with
coax although a balun would help. I strung this mess across the attic and
use it routinely from 40 to 10 meters with decent bandwith. The thing is real
finicky on 75/80, though, and won't load on 160. (The vertical did!)

Here are two CHEAP solutions to your problem- and they work okay. You won't
get a 5-9
+20 report from a submarine under the ice cap, but it will keep you on the
air. I have 80 worked towards DXCC with this mess, which isn't bad.

When I posted it to the net, a guy sent me a private reply where he took
the flexible clothes dryer hose (vinyl with steel wire inside, helically
wound) and used as an SWL antenna. I may go out and buy some, and try
it with the rig.

If all else fails, just get some wire and through it around.
Load it. But the slinky isn't as messy and keeps the XYL off your back.

73's and Good Luck.

>
> Ge' Weijers

Under the assumption that you are trying to use this over HF links, your
ability to use QAM techniques in a modem for this type of use are rather
limited. There are two main problems with HF when attempting to set up a
data link:

1) You can think of the ionosphere as an adaptive (rather, random)
filter, with its phase and amplitude characteristics changing
over time. It's characteristics are relatively unpredictable
and vary over time, frequency, and a host of other variables.

2) Multipath, though usually not noticeable to the human ear, is
a major concern. It is not uncommon to have multipath delays of
a few milliseconds, which is deadly to high(er) speed modems with
narrow sampling windows, and is generally a nuisance for low speed
modems (due to inter-symbol interference).

In short, encoding bits in the amplitude or phase of a signal to be used over
an HF link is generally not a Good Idea. The remaining variable, frequency,
is often used to convey the information. One technique commonly used is to
parse up the available spectrum (e.g. 3kHz) into several subbands, each of

which carries a sub-carrier. Each sub-carrier encodes a single bit, or if a pilot (reference) carrier is also available, potentially several bits through amplitude modulation (the latter is dependent upon the passband characteristics of the transmitting and receiving systems, and typically requires the systems to exchange training sequences). The baud rate is typically quite low, but the number of bits available per baud can be relatively high (>600 bps throughput). Often a DSP chip is used to do the encoding and decoding. One additional problem with this technique when driving an amateur-class transmitter is how much power is delivered to the modulator; some (most?) modulators begin to distort a signal of this type due to overloading. Most transmitters are not meant to be modulated with a signal that occupies a sizable chunk of the audio band (300Hz - 3kHz), relative to a typical speech signal.

The Telebit Trailblazer is a good example of a commercial product capable of achieving high data throughput using this technique. I believe the (now defunct?) AMSAT DSP project was to use this technique for its `high speed' HF communications protocol.

Does anyone know what the rules are if you are licensed in
more than one country? I know that in each country you hold a license
in, you must use the privleges and callsign assigned by that country,
but what happens if you go to a third country to operate?

In particular, I hold a Technician license in the US, and the
equivalent license in Swizterland. The licenses differ, however in
the assignment of powers and frequency allocations (for instance, Tech
class in Switzerland has no 50Mhz band privleges, and only 200 watts
maximum power). What happens if operate in Germany (which is 400
meters away for me). What happens if I operate MOBILE in Germany, etc?

By the way, would contacts made under both callsigns count as
one person for DXCC purposes?

366. Re: Radio Shack CTR-82 VOX

Newsgroup: rec.ham-radio
Date: 1990-01-17 17:28:58 UTC
From: flash@lopez.UUCP
Message-ID: <1108@lopez.UUCP>
Source record: 14031

I have one, and also the older CTR-75. After using both, I have the following observations.

I do NOT have the hum problem at all, using the proper 6v adaptor. Everyone I know has had problems using the MULTI VOLTAGE adaptor, although if you flip it to 4.5v this cuts the problem down a lot.

The recorder works perfectly with my pro 2005, sony ICF-2010 (on timer recording) and my kenwood TS-440 (using the squelch control). HOWEVER, I generally do not connect the radios directly to the recorder, but am running them through a radio shack four channel mixer, which also feeds an audio amplifier for listening through better speakers (through out my entire house). I also use a radio shack parametric equalizer to enhance the quality of the shortwave audio, and get really fine recordings.

Tell you the truth though, the 82 is not as good a machine as the 75 is, IMHO.

It seems "klunkier" The feel of the buttons is a LOT cheaper than the sturdier feel of the 75. I was not surprised when a poster said his first machine messed up mechanically and his record button would not stay down. The auto stop is on a hair trigger.

My machine ran too fast when I got it home, but I fixed that myself by removing the four screws on the bottom, (making note of which goes where, because there are two different sizes of screws) and removing the unit from the case, you will see clearly the phillips screw pot near the voltage regulator, which adjusts the speed. If you do not care about exchanging tapes, you can crank the speed down, and get five extra minutes per tape of recording time.

I also noticed that the audio quality is not as good on the 82 as it is on the 75. The 75 is definately LOUDER, and brighter sounding.

There are a couple of improvements on the new unit though. The 75 would allow you to hit record and rewind at the same time, and since they were right next to one another, I often did this, destroying my recordings!

The microphone has been moved a bit farther from the motor, but the motor on the 82 seems to be noisier. With the lower sensitivity of the audio amplifier, though, there IS less mic pick up (and less pick up of everything else)

All in all, the unit is definately worth the $30 sale price. It is not worth the 60 or 70 bucks that they normally get for it though. Not by a long shot.

Does the job for condensing the scanner stuff though. Great when searching new channels that I get from the dude that washes the police cars, and always checks out their digital readouts when dusting the radios off.

I bought one of these RS recorders and use it by tapping the AF OUT on a Yaesu FT767GX and the TAPE jack on a Bearcat BC-600. Everything works fine. What I am wondering, is if the level coming out of the Sony is adequate. Noise levels on the Yaesu that I would expect to trigger the VOX don't, however, so maybe that's the problem. Seems like their quality control is a little wide, judging by the varying reports...

You're in luck. Both chips are identical. You see, the generic number of the chip is 565. But manufacturers like to add their own prefixes and suffixes. Signetics starts a lot of their linear part numbers with NE or SE, depending on whether the part is usable over the commercial or military temperature ranges, respectively. Signetics also attaches a suffix: N = plastic DIP, F = ceramic DIP, D = surface mount, etc. The LM565CN number is from National Semiconductor. The LM means 'linear monolithic.' Other prefixes are: LF = linear FET, LH = linear hybrid, ADC = A/D converter, etc. The suffix C means commercial temperature range; no C means military range. N means plastic DIP, H means metal can, etc.

So, both the NE565N and the LM565CN are the same chip, made by different manufacturers.

I have just bought a PRO-2005 scanner unit from RS. So far, I find the reception and scanning rate quite good. However, I find the user interface to be very "modal" and non-intuitive. As with most consumer manuals, we are presented with a "cookbook" approach to operation rather than a solid presentation or flowchart-style template of the machine's user interface state diagram, memory organization (like just how much extra info is stored with each channel such as delay setting, lockout, etc.). Has anyone attempted a state diagram of this machine? Has anyone else found the UI to be frustrating?

Finally, I am also quite interested in modifying the 2005 to recieve the gaps in its frequency band. I'm suspect this has been posted before but I don't see it anymore. Any pointers to articles, what-have-you are appreciated.

Terry--

I played with RS-10/11 quite a bit for the first few months it was up. I worked the robot a couple of times, but it's been a while. And I don't have a QSL yet, but that's not surprising.

As I recall the plan is to go to the input frequency (-400 kHz (?) from the robot freq) and send close to the same speed as the robot. I think you send "RS-11 de your call K" and if it locks onto you, it will send "your call de RS-11 R QSO NR xxx 73" or something like that. If you're using 2 receivers, you can hear yourself on the robot freq is which is kinda wild.

I've completely lost the bubble on RS-10/11 today. Is it still active? Can you or someone give me times of good North American passes for the next 10 days or so (no long printout, just a couple of AOS, LOS times and lat/long will suffice).

Good luck--Jim, K6ZH

ARRL LETTER - Volume 8 - Number 26 - December 29, 1989 - Part 1 of 3

ARRL FILES PROPOSAL FOR AUTOMATIC HF OPERATION
OF RTTY AND DATA TRANSMISSIONS

On December 12, ARRL Counsel Chris Imlay, N3AKD filed a petition for rule making with FCC seeking the adoption of rules to permit limited HF RTTY and data communication under automatic control.

The 24 page petition draws on the experience gained during the past 2 1/2 years under the STA granted to the League in mid- 1987 permitting a limited number of packet radio stations (known as SKIPNET) to operate under automatic control on specific HF frequencies forming an organized "long haul" message forwarding network. The League's conclusion based on this experience is that the desirability of automatic operation on the HF bands has been firmly established and, in fact, it is now an integral part of the normal amateur radio activity in all ITU Regions.

The League's proposal seeks inclusion of automatically controlled AMTOR and Baudot as well as data modes. In the petition, ARRL says "The feasibility of automatically controlled operation on AMTOR has been demonstrated by US amateurs operating under special temporary authority. ..AMTOR is more robust than is packet radio and is used to bridge difficult radio paths. ..Thus, its operations under automatic control is not only feasible but necessary for the development and efficient operation of amateur networks. ..manually controlled Baudot RTTY `mailboxes' (or MSOs) have been active in the Amateur Radio Service since the early 1980s. ..the software controlling the mailboxes has provisions which allow the interrogating station to ask for repeats. Manual control of these mailboxes... is an unnecessary burden on the mailbox system operators. ...The technology and operational experience using each of these modes has matured to the point that this is now possible. ...the benefits of automatic operation are shared by amateur operators worldwide and are instantly available to provide public service during disasters."

The petition seeks designation of the following band segments as being available (not exclusively) for automatic control of RTTY and data transmissions:

- 3.605 to 3.615 MHz
- 7.035 to 7.045 MHz,

- 10.140 to 10.150 MHz
- 14.090 to 14.100 MHz
- 18.100 to 18.110 MHz
- 21.090 to 21.100 MHz
- 24.920 to 24.930 MHz
- 28.100 to 28.120 MHz.

In a separate letter to SKIPNET members, ARRL Executive Vice President Dave Sumner, K1ZZ, explained why these particular frequencies are suggested in ARRL's petition. Dave said that the ranges chosen in most bands are probably self-evident except for those in the 20 and 40 meter bands.

"The specific frequencies used by SKIPNET stations have shown that it's possible to shoehorn in with other U.S. users. But, we have received complaints from societies in other countries about HF packet frequencies, particularly in the 20 and 40 meter bands.

"On 20 meters, nearly every other country operates phone in the 14.100-14.150 MHz range, and packet operations in the lower part of that range have been a continual cause of concern to them. This has been the case in all ITU/IARU Regions including Region II--the Americas. The fact that some of their own packet operators use frequencies above 14.100 has not convinced the societies in other countries that this is a good place for packet. The worldwide consensus (with some reluctance on our part) is that packet should operate below 14.100. Of course, that puts pressure on the Baudot RTTYers and AMTOR RTTYers just below them in frequency and ultimately on the CW operations.

"On 40 meters, most countries have a narrower band--only 7.0 to 7.1 MHz--into which they must squeeze CW, RTTY, packet, phone and image communications. Around 7.040, or even as low as 7.030, is where their phone band starts. So, you can understand why there might be contention over packet and RTTY around 7.090.

"The frequency segments for each band were chosen after careful review of domestic and international implications. While we knew to begin with that there was no such thing as a "perfect fit," we had to try for a "best fit" solution. Please bear in mind that we now have a viable packet network that is worldwide in scope. As such, we need to use frequencies that are compatible with the rest of the world. Even with the frequency segments chosen, there may still be the need for future adjustments, both by us and in other countries to finally arrive at common segments for automatic operation.

"We anticipate that individuals may wish to suggest some changes in the frequency segments proposed by the League. We believe such inputs to be helpful in cases where commenters take the time to consider the domestic and international implications of their proposals."

At press time, the FCC has not yet assigned an RM number.

ARRL LETTER - Volume 8 - Number 26 - December 29, 1989 - Part 2 of 3

CHUCK BENDER, W1WPR, W1AW CHIEF OPERATOR EMERITUS

W1AW Chief Operator Chuck Bender, W1WPR, completed his final shift Saturday night local time, December 23. With 38 continuous years of service to ARRL, Chuck has the distinction of holding the record for longest term as a W1AW operator. The final transmission from W1AW with W1WPR at the controls was the 0545 December 24 UTC phone bulletin.

Hundreds of amateurs, worldwide have sent well wishes to Chuck through the mail and by Amateur Radio using the National Traffic System (NTS). Chuck's retirement was announced in the December, 1989 QST, Happenings column.

AMSAT CSDP VOLUNTEERS SOUGHT

With the upcoming launch of the four AMSAT Microsats, AMSAT- NA is looking for additional satellite enthusiasts willing to volunteer their time to become part of the Command Station Development Program (CSDP). The CSDP is designed to train amateur satellite enthusiasts to become competent spacecraft controllers including telemetry collection techniques and analysis for the purposes of determining the condition of a spacecraft in orbit.

There are various levels of participation for interested volunteers; the first levels develop proficiency in telemetry collection and analysis. The highest level involves actual control of one of the OSCAR satellites. Applicants must be currently capable of operation on Mode A, B, or J.

If you would like more information about the CSDP and the various levels of participation, send a SASE to Bruce Rahn, WB9ANQ, Technical Coordinator for the CSDP, 410 Coronado Trail, Enon, Ohio, 45323.

FCC PROPOSES HIKERS' LOCATOR IN 220 MHZ

The Commission on Tuesday December 12 proposed the establishment of a Personal Emergency Locator Transmitter Service (PELTS), that would provide individuals in remote areas with a means of alerting others of an emergency situation and to help search and rescue personnel locate those in distress.

The Commission pointed out that a growing number of persons are participating in outdoor activities resulting in an increased number of situations requiring immediate emergency assistance. For example, nine teenage climbers were caught in a severe unexpected storm on Oregon's Mt Hood and lost their lives. Four skiers died under an avalanche at Breckenridge, CO. These individuals might have been saved if they had a means of signaling to rescuers.

The Commission says it has two objectives in establishing the PELTS. The first is to provide for an areawide, centrally coordinated radio communications system for use by the general public in remote areas thereby reducing response time in emergency situations. The second objective is to reduce the illegal use of Emergency Locator Transmitters (ELTs) and Emergency Position Indicating Radio Beacons (EPIRBs) as personal locating beacons. ELTs and EPIRBs are emergency radiobeacons used to assist search and rescue units in locating downed aircraft and vessels in distress.

PELTS would consist of a base station and associated portable units. Only governmental agencies or private search and rescue organizations would be eligible for base station licensing, to assure that use will be limited to distress and assistance communications, but portables would not be restricted.

The FCC proposed to use 50 kHz of the reallocated 220-222 MHz band for PELTS, in five frequency pairs. To offer the public some assurance that the equipment is safe and likely to perform its intended function, the Commission proposed technical standards and design specifications for PELTS equipment. The actual text of PR Docket 89-599 has not yet been released; comment deadlines are not available at this time.

The ARRL will seek a stay of this Docket and PR Docket 89- 552, FCC's proposed service rules for land mobile operation on 220-222 MHz, if the rulemaking process reaches the Report and Order stage before the US Court of Appeals for the DC Circuit has made a decision on the ARRL request for review of FCC's reallocation decision in Docket 87-14.

FCC FIELD OFFICE ADDRESS CHANGES

The FCC San Francisco Regional Office has moved. The new address is: FCC Regional Office, 211 Main St, Room 537, San Francisco, CA 94105 Tel: 415-744-2722. The FCC San Francisco Field Office has new phone numbers but they remain on Battery Street in San Francisco.

The FCC Chicago Field Office reports that they have new phone numbers. The new numbers are 312-353-0195 and 708-298-5171. The address is: FCC Chicago Field Office, Park Ridge Office Center, Room 306. 1550 Northwest Highway, Park Ridge, IL 60068.

ARRL LETTER - Volume 8 - Number 26 - December 29, 1989 - Part 3 of 3

PUBLIC INVITED TO COMMENT ON WARC-92

The Federal Communications Commission on December 13 released a Notice of Inquiry, General Docket 89-554, relating to preparation for the ITU World Administrative Radio Conference (WARC-92) dealing with frequency allocations in certain parts of the spectrum. The proceeding is intended to generate public comment regarding Commission preparations for the conference. The International Telecommunication Union has scheduled the conference for the first quarter of 1992 in Spain. The Notice of Inquiry sets forth a number of questions, many quite detailed and technical, on which it would like comments by a deadline of February 16, 1990; reply comments can be filed until March 16. As usual, formal participation calls for an original and five copies of all papers. This docket will be considered by the ARRL Board at its January meeting.

The agenda for WARC-92 will be set by the ITU Administrative Council, probably at its meeting in the spring of 1990. However, the following areas for possible WARC-92 study and action have been identified during specialized WARCs held in the past few years:

* International broadcasting allocations, particularly between 5950 and 26,100 kHz

* Mobile satellite and other mobile services between 1 and 3 GHz

* A proposed broadcasting sound satellite system between 500 MHz and 3 GHz

* High definition TV satellite service in 12.7-23 GHz

* Other proposed space services above 20 GHz

The Commission intends to establish a joint industry government advisory committee to assist it in preparing for WARC- 92, as has been done in the past. The advisory committee will be governed by the provisions of the Federal Advisory Committee Act of 1972 as amended. The ARRL has served on FCC advisory committees preparing for earlier WARCs and intends to do so again.

The ARRL staff committee for WARC-92 has already begun studying the spectrum management process, the issues likely to come before WARC-92, the ways in which amateurs can help determine US positions for the WARC, technical issues such as the criteria for successful band sharing.

PLAQUE PRESENTED HONORING 1921 TRANSATLANTIC TEST SITE

In a joint venture, both the ARRL and the Radio Society of Great Britain (RSGB) have been instrumental in placing a bronze plaque at the site of Paul Godley's first successful receiving station used in the famous 1921 transatlantic tests. Although an ARRL representative had planned to attend the dedication, an unfortunate set of circumstances prevented it.

In a letter which was read at the December 11 dedication, Dave Sumner, K1ZZ, noted that it was at that site in Ardrossan, Scotland where the first Amateur Radio signals were heard from across the Atlantic and the intercontinental dimension of our beloved avocation was born. Like so much in Amateur Radio, the plaque owes its existence to one individual. Ian Elliot, W7JMX, of Bozeman, Montana, first conceived the idea of the plaque and it is through his generosity which made it possible.

PACKET RADIO MANUAL AVAILABLE IN BRAILLE

Northern Nevada Braille Transcribers, a volunteer, nonprofit, tax-exempt group, now has the MFJ-1270 TNC 2 Packet Radio Owners Manual available in braille. It is contained in six volumes of various lengths. It is also available on an Apple computer floppy disk.

This braille manuscript is available without charge to anyone who can use it. However, contributions in any amount are gratefully accepted. Interested parties can write for additional information to: Northern Nevada Braille Transcribers, 1015 Oxford Avenue, Sparks, NV. 89431.

FCC UPHOLDS BUREAU IMPOSED FORFEITURE AGAINST AMATEUR

On December 12 the FCC upheld the Private Radio Bureau's action which imposed a $1200 forfeiture against amateur radio operator David B. Hodges, N3DTH, for malicious interference and for failure to identify, in violation

of FCC rules.

The FCC had received a number of complaints of interference to the Baltimore Radio Amateur Television Society amateur repeater. Subsequently, FCC engineers observed interference which they determined came from Hodges' amateur station.

Although Hodges said he did not recall whether he made transmissions on any specific date he admitted that on occasion he made such transmissions to cause interference when provoked by others. In his defense, Hodges noted his public service activities and that he had not previously been cited for any violation. He also promised he would not commit violations in the future.

FCC noted that such transmissions serve no legitimate purpose and were clearly intended to cause harmful interference. Hodges' failure to identify his transmissions was obviously intended to make detection difficult. The Commission concluded that none of his arguments excused or mitigated the violations.

Subject: re: ICOM Handheld receiver
To: info-hams@wsmr-simtel20.army.mil

The IC-R9000 has been available for several months and is definitely
not handheld.

ICOM has released (in Japan but not in the US yet):

- handheld, 150 khz to 1300 mhz, 100 memories, 11 search step
increments (.5,1,5,9,10,12.5,15,20,25,30 khz), s-meter,
and tuning knob. Expected price is around $600

- Mobile version of above (I believe like the Kenwood RZ-1)

- A lower cost version of the R71-A with 99 memories.

This is all from the January "Monitoring Times", page 37.

If anyone hears more about these, let us know!

<Mike Pflueger tells about Professor Kraus' solution to carrying
broadcast signals in tunnels using a wire extending beyond the end of
the tunnel...>

Yup. Never thought about it myself, but that's a great idea.
It'd be topologically equivalent to a coaxial cable, which has no cutoff
frequency for the TEM mode.

Now *here's* an interesting question, particularly for anyone
like me who has spent half an hour in a tunnel during a traffic jam:
Why do we allow tunnels to be built without such gizmos installed in
them?

Jeff Carroll

>
> Gary, WB2BOO

The Holland tunnel is an imperfect waveguide - the sides do not have
infinite conductivity, hence there is not total internal reflection.
There is absorption inside the tunnel. But, it's a good enough waveguide
to cutoff the AM freqs, which have wavelengths >> (much greater than)
cutoff.

Also, the signal is not very well coupled. And there is an abrupt impedance
change at the entrance (and exit) of the tunnel.

Excuses, excuses, excuses.

From: bobm@qip.UUCP
Message-ID: <1784@qip.UUCP>
Source record: 14035

I'm looking to pick up the GOES satellites signals and am wondering
whether it's better to build a small dish (2-4 ft) or use a yagi antenna.

Does anyone know it a small dish would pick up the signal any better
than a yagi ?? (the yagi will be around 110 inches long).

I plan to build my own LNA either way and if anyone has seen any articles
on this I'd appriciate the leads.

Currently I receive WEFAX's on the shortwave band, but the frequency and
map types aren't enough to plot storm travel (I use the SanFran site).

thanks
bob

.................................................................
```

In the above example I have a 'from:' line in my message. That will
tell the server to send to an id other than the id listed in the
header. The userid should be reachable from bitnet. That means
UUCP users should include a gateway in their id.

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable
address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:
userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

> far away) and according to my notes, they are using verticle polarization.

It depends on where you live. Just like band plans have local variations, so does the polarization of ATV. Call some "CQ ATV"'s on 144.340 Mhz FM and ask around your area. 144.340 is the frequency most ATV'ers contact each other on for voice communication. Here in Illinois, and also in Ohio, the polarization in use is horizontal. An ATV repeater in Indianapolis is reported going to switch from vertical to horizontal.

Personally, I think horizontal should be used for ATV DX work, just as it is for UHF CW/SSB DX work. For purposes of widening the coverage of small ATV stations, that's subjective. Vertical is easier to do omnidirectional, especially for portable station (just stick on a 1/4 wave or 1/2 wave whip and you are in business). Sometimes repeaters would be used to give DX access to stations for which that would be hopeless, and serve other purposes as well. What such stations might consider doing is dual polarization for the repeater. If the signal comes in stronger on the vertical, transmit vertical. Same for the horizontal. Maybe circular could be included.

If you don't want to run all the conduit, (which by the way is an
excellent idea), at least wire up the 220v for a amplifier, and
make some provision for the two or three coax cables that will
be run. By the way, you can get a good dc ground on the 2nd
story, but forget a rf ground. To achieve the rf ground you will
need something like the MFJ artificial (virtural?) ground - an
antenna tunner for your ground. Or at least some counterpoise
wires for each band. Those work fine, I used them in apartments.
You might give some thought to were the tower will be (or is) and
how to get the cables to that in a nice neat fashion. Boy what
an opportunity to blue sky about your future shack and what you
could put in !!!!

>and AIR MAIL and AIREAU MAILEAU, or however you say Air Mail in French,
>(I think it is actually Par Avion) is imprinted on the envelope.

I have a bunch of envelopes that fit John's description and which I
use as SAEs for overseas QSLing, but they are *not* European sized.
They only hold US-sized QSL cards, so like Steven, I occasionally
receive a QSL card that had to be folded to fit into the envelope.
(Actually, what usually happens is that the nice ham on the other end
keeps my SAE and makes out a new, larger envelope for me.)

Perhaps some stationery stores call these (mine are 4 x 7.5 inches)
"European Air Mail" envelopes, but I'm sure they aren't the ones
Steven was referring to.

So if you go looking for envelopes to prevent the folded-QSL problem,
make sure they are the 11 x 16cm ones and not the smaller U.S. ones
that say "Air Mail". It sounds like DX QSL Associates (mentioned in
Derek's posting) have the right ones.

Speaking of QSLs, I got my U4MIR card yesterday!!!

It's because the AM signals are low frequency = long wavelength and
those long waves can't fit into the opening of the tunnel like the
hi-frequency FM signals can.

Similar reason FM/high-frequency signals don't propogate as far as
AM//low-frequency:

One way to START to deal with the problem is to ABSOLUTELY refuse to buy
ANY radio from the company that makes the ones you don't want on the market.

Remember, the companies operate for two reasons: profit and more profit.

You have to hit them where it hurts, in the pocketbook and on the bottom line.

If that tactic doesn't work, then the NEXT step after that is to (after a
short warning period) refuse to buy ANYTHING from ANY dealer that even
CARRIES the brands that make that equipment. Thus you would be threatening
to hurt (financially) even those who helping the bad companies make money.

In article <BOB.90Jan17123008@volitans.MorningStar.Com> by
bob@MorningStar.Com (Bob Sutterfield) to alt.sources,rec.ham-radio, he writes:

" In article <899@tridom.uucp> wht@tridom.uucp (Warren Tucker) writes:
v03i079 contains a GREAT program utc.c which allows your system to
mimic NBS and provide esentially the same service via a local call.
Only the most ultimate time freaks who've replaced their PC's
crystal with an atomic clock can tell the difference (I'm pretty
bad, but not that bad) :-).

I'd hope that only folks either running a local radio clock, or a low-
stratum NTP peer, would offer their system's time as a community
standard. However, this would be a really nice service for Internet-
connected folks to offer to their UUCP-only neighbors.
"

Is there some ESP going on here? :-)

I've put together a prototype system that does just what Karl describes. My
time reference is a HeathKit GC-1000 "Most Accurate Clock" which locks onto
NIST's (formerly NBS') WWV at 5, 10 or 15 MHz to provide +/- 10 mSec Universal
Time Coordinated on its RS-232c port. I've been testing the setup since:

```
$ loglook utc
Login ID First Last Name
-------- -------------------- -------------------- --------------------
utc Sat 14-Oct-89 17:59:07 Thu 18-Jan-90 23:12:28 UTC time service
^^^^^^^^^
```

Note that date; 3 days later my antenna snapped during the earthquake, and I
haven't repaired it ... I'm in Silicon Valley, and the antenna is a huge
inverted "V" whose apex WAS at the top of a 40' tower. :-(

At the moment, one of my systems calls the US Naval Observatory service in
Washington DC every 2 days to maintain time-sync locally, but once I repair
the antenna AND get some more phone lines installed, this service will be
publicly online and I'll post its availability along with all the software.

I use the service to coordinate time for all my LAN-based systems. The server
provides a time reference identical to the USNO per:

```
*
jjjjj ddd hhmmss UTC
```

where: jjjjj Julian date modulo 2400000
ddd days since beginning of year
hhmmss time of day in Universal Time Coordinated

based on a program by Michael Scott Baldwin of AT&T Bell Labs.

If you'd like to install and provide such a service on your system, you need an accurate time reference (the Heath clock is my recommendation: kit price from their Winter 1990 Catalog No. 219 is $249.95 for the clock and $49.95 for the RS-232 interface (see page 28)), and:

```
$ ls -l /usr/local/bin/utcs*
-rwxr-xr-x 1 thad users 3156 Oct 14 17:22 /usr/local/bin/utcservice

$ file /usr/local/bin/utcs*
/usr/local/bin/utcservice: mc68k executable (shared demand paged with \
shared library) -F (0413 demand paged)
```

and entries for /etc/passwd:

```
utc::50:50:UTC time service:/usr/local/bin:/usr/local/bin/utcservice
```

and /etc/group:

```
utcpub::50:utc
```

All a client system(s) need do is install the "capture" program and execute it per:

```
# must run this as super-user
#
echo "\nutc" | cu thadlabs | /usr/local/bin/utcset -s
exit 0
```

from a crontab entry like the following:

```
#Mn Hr Da Mo Da (0=SUN, 1=MON, 2=TUE, 3=WED, 4=THU, 5=FRI, 6=SAT)
#of of of of of
#Hr Da Mo Yr Wk Command
#
03 3 * * * /bin/su root -c "/usr/local/bin/utcset.sh >/dev/null"
```

assuming one has a /usr/lib/uucp/Systems (or L.sys) entry for the server.

The above is how I've configured the service to date. Because some "cu" don't seem to respond to SIGPIPE properly, I'm planning on generalizing the client program to itself connect and retrieve the server info, and will post the whole package when it's complete. If someone would like to help (my time is VERY limited) and/or you'd like some more info, feel welcome to contact me:

AGENCY ENTERTAINS YET ANOTHER
PERSONAL COMMUNICATIONS REQUEST

STATUS: PCN America has filed with the FCC the third experimental application that agency has received for a personal communications network (PCN). A subsidiary of the British concern Millicom, PCN America asked the Commission for the license to provide PCN services in the Washington, D.C., area.

The company asked for use of radio spectrum in the 1850-1990 MHz band, which is currently used for operational fixed microwave service. PCN America's experimental application proposes to share the spectrum through spread spectrum technology.

COMMENTS: The FCC has granted authority to the first two applicants, Cellular 21 and Cellular General, to run trials in New York and Florida.

Several other companies, including International Mobile Marine in Philadelphia and American Telezone in Houston, plan to experiment with various microcell communications systems in 1990.

American Telezone is planning a system similar to the United Kingdom's Telepoint system and says that it will be available to subscribers by third quarter 1990. It plans to operate under Part 15 of the FCC's rules which do not require licensed radio spectrum.

PCN America has also asked the FCC to permanently allocate radio spectrum for the provision of a PCN. Reply comments are due on that proposal on Jan. 16.

SOFTWARE GLITCH AT AT&T CUTS OFF PHONE SERVICE FOR MILLIONS, p.B1.
"New York-A software glitch shut down American Telephone & Telegraph Co.'s long-distance phone network, cutting off service to tens of millions of customers nationwide. Computers in AT&T's network center in Bedminster, N.J., detected the cut off of calls around 2:30 p.m. EST, according to an AT&T spokesman. The massive shutdown was the first to hit the company nationwide and continued into the evening as tens of millions of callers got busy signals when they tried to dial beyond their local calling areas."

THE WALL STREET JOURNAL, 1/17.

ADVERTISING: US SPRINT TRIES TO REACH OUT AND THUMP AT&T OVER SNAFU, p.B1.
"American Telephone & Telegraph had a disaster on its hands when its long-distance telephone network crashed Monday. For AT&T's competitors, though, the celebration is just beginning. The embarrassing glitch for AT&T was like a late Christmas gift for its long-distance competitors. And at least one competitor hopes to milk it, in advertising terms anyway, for all

it's worth. By Monday night, major competitor US Sprint and its ad agency, J. Walter Thompson Co., were already huddling to consider an ad playing on the AT&T system collapse. By yesterday afternoon, Sprint an WPP Group's Thompson had come up with a dozen possible newspaper ads, one of which makes its debut today."

THE NEW YORK TIMES, 1/17.

A.T.&T. PINPOINTS CAUSE OF PHONE DISRUPTION, p.A1.
"The American Telephone and Telegraph Company said yesterday that it had traced the huge disruption in long-distance service that occurred Monday to a single computer program that malfunctioned and caused a chain reaction in the network. Company executives said the malfunction occurred in a program at a giant computer switching station in the New York metropolitan area, causing the computer to send out alarm messages to other switching stations."

A SUPER HUMAN COLLAPSE, p.B7.
"The failure of American Telephone and Telegraph Company's long distance switching system on Monday is a warning of the troubling vulnerability of the nation's complex computer networks to unpredictable breakdowns, either accidental or deliberate, computer scientists said yesterday. The computer systems that increasingly control telephones, bank cash machines, electric power and other routine daily necessities are growing so complex that they defy human understanding, thus making it all but impossible to predict all the ways they might fail."

USA TODAY, 1/17.

CBS BENCHES RIVAL ANNOUNCERS, p.1A.
"CBS -- trying to protect its turf -- told Nike to 'just do it.' CBS, which televises the Super Bowl Jan. 28, had Nike cut NBC's Marv Albert and Dick Enberg, ABC's Al Michaels and ABC/ESPN's Dick Vitale from its new commercial, debuting during The Big Game...CBS requested that Enberg be dropped from the Nike ad while a commercial where he's spokesperson for GTE will run during the Super Bowl."

>

I agree that VOA is pretty good and tries to be fair in its news. It routinely includes unfavorable stories about the US that a propaganda (in the common, incorrect use of the word) station wouldn't carry.

Of course, this in itself might be considered propaganda in that it demonstrates one of the basic princples of American Democracy which is freedom of expression and dissent!

By the way, VOA is prohibited by Congress from orienting its programs toward Americans, hence the policy on program guides and QSL's. They used to QSL to Americans until they were told to stop.

403. Re: Pure LO signals and Mixers?

Newsgroup: rec.ham-radio
Date: 1990-01-19 14:29:54 UTC
From: gb@sunpix.East.Sun.COM
Message-ID: <1090@dixie.East.Sun.COM>
Source record: 14057

I believe that double-balanced hot-carrier-diode mixers are often followed by a stage of amplification to allow proper termination of the mixer. If these mixers are not terminated in a resistive load of near 50 ohms at all frequencies, their strong signal handling characteristics can be significantly compromised. It is not hard to build a post mixer amplifier that can handle larger signal levels than the mixer is capable of delivering without distortion.

Another reason for post mixer amplification is system noise figure. Without the amplifier a typical front-end may have 1dB of loss in the input filters, 6dB loss in the mixer, 3dB loss in a pad for terminating the mixer, 4dB loss in the crystal filter, and finally an IF stage with 2dB noise figure resulting in a system noise figure of about 16dB, a little high for 10 meters.

With a post-mixer amplifier having a 2dB noise figure, the system noise figure can be held to 9dB which is more reasonable. This is with no degradation in strong signal handling ability since the post-mixer amplifier has been (hopefully) designed to have a larger input intercept than the output intercept of the mixer.

I have used the 7360 and totally agree with your comments. Properly used it is superior to almost anything else. Even better is the 6JH8, a similar tuble that has greater linearity and will handle 60 VOLTS of input signal with the signal applied to the deflection plates. This type of mixer is well worth incorporating even in a receiver that is otherwise all semiconductor.

r.e. Minature FM receivers.

Have a look at TDA7000. Its a one chip FM radio, with RF, mixer, LO
IF amp and phase demod, simply put the output into a single chip
P.A. like the LM386. Sensitivity 1.5uV for -3dB limiting, supply 2.7
to 10 volts @ about 8mA. Frequency range is 1.5MHz to 110MHz but it will
work up to 148MHz :-). The 18 pin chip uses the FM equivilent of direct
conversion, with a very low frequency IF. The data sheet gives details
how to use it for broadcast reception. For NBFM it is possible to re-
configure the IF filters to suit. There was an article published this
side of the pond in RSGB Radio Communications Jan 1989 about the mods
needed for NBFM and also to modify the LC oscillator for crystal control/
stability. Its hardly a state of the art receiver but its a nice and simple
project. I can post more info if anyones interested. I found at
least one error in the published schematic, C14 should go across pins
10 and 11.

408. Noise under 530khz

Newsgroup: rec.ham-radio
Date: 1990-01-19 17:10:05 UTC
From: tsf@druhi.ATT.COM
Message-ID: <4621@druhi.ATT.COM>
Source record: 14061

From a novice LF'er -
When I listen to the frequencies from 100-530Khz I always hear
a lot of "noise". Not the crashing static from lightning, or
a hiss or burbles from the receiver, but a very loud S9 buzz.
It makes me think that I'm picking up my flourescent lights, or
an arc of some kind. I can hear a lot of beacons, id'ing in CW, and
these stations, if they're strong enough, quiet the buzz even
without moving the S meter above S9 (not an AGC effect, then?).
I'm new to this area of the radio spectrum. Can anyone tell me
what this buzz is? It also shows up to a lesser degree in the
low end of the BC band (below about 600Khz), and it doesn't
seem to be sensitive to location. It sounds the same within the
20 mile radius of my normal travels. I've tried turning off
everything electrical in the house except the radio just to see
if it could be a local effect with no luck. The noise limiter on
my IC-751 helps a little.

>from their Winter 1990 Catalog No. 219 is $249.95 for the clock and $49.95 for
>the RS-232 interface (see page 28)), and:

I just finished building this kit, and the clock is very neat. But imagine
my surprise when I plug it in and find the digits in the display are all
messed up! After a bit of debugging, imagine my astonishment in finding
an error in the printed circuit board layout!!! Two of the digit anodes
were shorted together, not by any impurity or solder bridge, but by
a neat, straight, designed-in board trace.

A flash of the exacto knife, a severed trace, and now the clock works fine.

Anybody from Heath on the net?

Hey, this program is really spiffy, but what exactly is NBS?
I am assuming it's a standard time sort of system, could some-
one expound a bit for me and others who don't know?

Thanks for the program...

Just some friendly advice:

When you mod the 02AT, make sure you program the transmit offset so that you transmit somewhere in the ham band, rather than QRMing NOAA, just in case you bump the transmit key.

You might consider Electron, published by the VERON (Dutch amateur radio
society). It's been a while since I've seen it, unfortunately. It has
(or had when I read it) a monthly column by PAoSE ("Reflections") which
is generally excellent.

Theoretically, an ATV exciter should be followed by a truly linear
amplifier. Since linear amps are less efficient than class C, this would
argue for using an unmodulated exciter and modulating the PA.

However I think linearity is less important with ATV than other AM modes.
The signal is ALREADY wideband, so you don't have to worry (within reason)
about splatter. The main effect is to alter the gray scale (contrast and
brightness), which can be adjusted for in the modulator.

I am building a all home brew ATV station. I just completed the oscillator chain and have about 70mw on 439.25 . I am now looking to build the power amp and video modulator. From what I have seen and read elsewhere it would appear there are two different ways of adding the modulation.

1) Modulate the low power stage and follow it with a linear amp.

2) Feed the low power stage to a modulated class C amp.

Anyone care to comment on the methode they would choose and why?
Thanks,

>Re: W1AW schedule
>Re: Redundancy and band occupation

Yes, this is my point. Sorry for not being clear. While not technically a violation, W1AW seems to be using more power than necessary to maintain communications by employing redundant bands.

Maybe I miss the point - maybe the point of W1AW is to showcase all the modes available to ham operators. Maybe W1AW is used for testing receivers because it is always there.

Some other observations:
* Not everyone can receive a CW bulletin at the blistering speed W1AW uses.
* Some redundant band examples: daytime local 2m/80m gnd wave. Nite DX on 20/40/80.
* Usage of 10/15 at nite.
* Numerous digital modes - packet/RTTY/Amtor/CW. It might make sense for W1AW to send RTTY, with local converters to 2m packet.

A group of bright folks like ARRL should be able to optimize their band usage by using flux data, time of day, beam orientation, etc. Maybe they could save money on their power bill, to boot. :v)

As far as CW practice, I think it is a useful service.

> Specifically, the SF earthquake and the hurricane. What
> I'm interested in hearing from some hams from the area is: Did your towner
> survive? Did your tower survive even if your house was damaged?

I live in Cupertino 3 miles from the San Andreas fault. My Tristao 55 foot pipe tower was cranked all the way up and suffered *no* damage whatsoever. It's entirely self supporting (no house bracket or guy wires) on a tilt over/rotating base. It has a KT-34A (4 elements on 16 foot boom) on top.

Bookshelves on a solid concrete slab fell over in the quake. Equipment on casters moved several feet on the slab. My linear slid off the shelf and broke. And it doesn't slide easily.

The house suffered "cosmetic" damage to the sheetrock. Some new cracks appeared in sidewalks and existing ones widened noticably. Some gas mains broke. Some doors in the house don't work as well as before the quake. One of the doors that fit poorly works better!

So my conclusion is that a ham tower is probably more of an advantage in a quake (for post quake communications) than a liability.

You forgot $%^&%&*#%$ taxi drivers.

> Sigh. Does the UK
> (or anyone else?) have a CB band between 26 and 28 MHz.?

Britain's CB range is 27.60125Mc to 27.99125Mc. I gather (from a not terribly helpful text) that the range of CB bands stretches from 26 to 28 in various pieces in different countries.

> the manufacturers seem hell-bent to create products for the
> bootleggers..I say the FCC/ITU should clampdown on them..make them build
> CB gear that CANNOT be modified to operate above 27.995, this *might* slow
> the bastards down a little. Grrrr!

They have tried this. In most countries, you can't design new radios which are easily modified (the FCC, in particular, won't give type acceptance to new rigs unless the PLL/divider will reject illegal channel numbers). The problem is in banning the sale of old rigs which still have type acceptance (if UPS could buy 2MHz of ham band, what chances the FCC would irritate the CB manufacturers?).

This information comes from "The CB PLL Data Book", by Lou Franklin. I am planning to modify a CB rig for 10m (don't worry, I *am* a licensed ham), but the book isn't as helpful as it could be, since it is more oriented toward helping you select the right CB rig for modification to illegal CB frequencies using commonly-available modification kits...

However, for VSB, that "true linearity" is essential. Any compression of the waveform envelope due to non-linearity constitutes some negative amplitude modulation without any corresponding phase modulation, which will generate sidebands on BOTH sides of the carrier. Since this will represent (non-linear) negative video, the upper sideband of VSB will be reduced somewhat, as will the low 1 Mhz or so of the lower sideband (which is part of VSB), but the rub is that a significant amount of RF will be generated in the remainder of the lower sideband, including a redundant audio subcarrier at -4.5 Mhz if the + one was used. Also, due to the non-linearity, additional splatter at a lower level will be seen outside of the expected AM bandpass. Listen to +9 Mhz above the carrier frequency for a duplicate of the audio subcarrier.

I recently acquired a pair of Murphy B-40 and B-41 general coverage
receivers (0.5 - 30 Mc and 15 - 500 Kc, resp.). Both radios are
still in working order.

However, the chassis of both show heavy signs of corrosion, and, what's
worse, various switches such as the coil-drum and mode-select also
seem to have been affected to the point that the contacts become
unreliable (the long wave receiver in particular).

So, I am in need of advice about the best way to go about cleaning
these devices and getting the switches to function reliable again.

Also, what kind of antenna will be most suitable for reception
of very low frequency bands (< 100Kc). I have been experimenting
with a long wire of about 30 meters length, without much succes.

Thank you,

Paul Kranenburg, Dept. C. Sc., Leiden, NL.

If the walls of the tunnel/subway involved large amounts of metallic
conductors, it would behave like a humongous waveguide, wouldn't it?

As for the subway, the rails would be a dandy parallel conductor transmission
line. I had some friends who were at Ohio University in the 50's. Their campus
carrier current station could not be heard off campus except in close proximity
to the tracks of the university's freight spur line. You could hear the station
briefly (5 seconds or so) as you passed the line's rail crossing of the highway
about four miles out of town.

I wonder if anyone has tried using office building ventilation ducts as
waveguides for wireless LAN's?

The more sophisticated duplexers are arranged in a bridge configuration with the resonant cavities acting as phasing sections to provide isolation considerably enhanced over simple brute force filtering. Tricky to align but well worth the effort.

GREETINGS FROM THE MICROSAT & UoSAT TEAMS IN KOUROU:

Last night the AMSAT, UoSAT, and BRAMSAT teams went through a complete launch rehersal so that we could check all communication lines and so that we would know what to expect. During the rehersal we had a simulated problem, the count was held, but we launched on time moments before the window closed! How is that for realism. We were also given a complete set of orbital elements and amazingly, they were exactly NOMINAL. Imagaine that.

We are now charging the batteries on the MICROSATs and UoSATs twelve hours a day. All the MICROSAT batteries are around 11 volts after at the end of day and when we come in morning, the batteries are about 10 volts for each of the MICROSATs. The UoSATs fly cold and their batteries are in excellent condition.

Events are moving quite quickly here. People are arriving, launch computers are constantly running tests on the launcher, and the pace has certainly picked up here. I liken the situation to a freight train starting up and hitting maximum speed around the morning of launch. So far the weather does not appear to be a problem. The weather constraints for launch are the following:

1) No lighting in the immediate area
2) To move the gantry back, the wind speed has to be less than 38 mph
3) For launch, the wind speed limits can be between 20 mph and 31 mph, depending on the direction. The high limit (31 mph) is the restriction if the wind is blowing out of the south; the lower limit (20 mph) is the limit if the wind is coming from the north. We are not exactly sure of why this is the case and we will investigate this and report back later.
4) Horiztonal visibility has to be 600 meters or about 0.4 miles.
5) The cloud ceiling higher than 250 meters or about 820 ft. This constraint is because the Range Safety people have to be able to see the launcher immediately after launch and before the radars can start to track.

On launch day we will be posting status reports about every hour or so. So please monitor T-MAIL.

Subj: Launch TV coverage

Arianespace informs us that if the launch slips by 1 day (yes it can..not 2 as previously) the launch coverage will be on Spacenet 1 Transponder 4 Sunday night. Saturday nights coverage will be from 8PM to 9:30PM EST exactly coinciding with the ALINS Net. Saturday watch Spacenet 3, Transponder 6, CH.11.

Subj: LAUNCH DAY STATUS RPT #1

Lauch Stautus Report at 11:45 UTC

Greetings From Kourou:

According to Arianespace officials, everything is moving along very well. Last night there was a problem fueling the first stage with UDMH but that problem was resolved. Right now I am charging the MICROSAT & UoSat batteries. At 15:30 UTC I will shut off the battery chargers and go to the press conference. After the press conference I will come back and charge until 22:00 UTC. The weather looks good outside at the present time, but the weather is so changable here. Two nights ago it was raining extremely hard at launch time. Last night we could have launched.

The next MAJOR milestone we have to get passed is the fueling of the 3rd stage. That is an extremely delicate and difficult operation. That will happen at about T-6 hours.

I will be posting several bulletins here on T-MAIL throughout the day. So far it looks like we might have a launch tonight!!!!!

Subj: LAUNCH DAY STATUS RPT #2

Launch Status at 15:30 UTC

I talked with several Operations personel here in the block house and they say everything is proceeding well at this point in the launch chronology. Also they say that the weather people say that the forcast looks good for this evening. Right now I can see sunshine but there are quite a few clouds in the sky. Jean Grau, Inspector General of CNES and I think his ham radio call is F8ZS or something like that, came by to pay me a visit. Jean told me that the French ham radio satellite should be ready to fly by

1992. So I am off to the press conference now and I will report back
later.

Everything still looks good for launch.

Subj: LAUNCH DAY STATUS REPORT #4

LAUNCH DAY STATUS REPORT #3 at 18:30 UTC

Greetings From Kourou:

The weather has deteriorated a little here. There are clouds almost all
around the launcher and the wind is blowing about 11 meters/second. But
the launcher is still ready to go and the current weather condition would
not stop us from launching. They will start to move the gantry away in
about 15 minutes at 18:45 UTC. I will be allowed to go out and take pictures.
I will start to put status reports on every hour until I leave for the
Jupiter Mission Control room.

73's Dave Cowdin, WD0HHU

Subj: LAUNCH DAY STATUS #3.5

TIME = 19:10 utc

They have just rolled the gantry back and talk about a skinny rocket! There are no strap on boosters. But the weather is holding and things are really rolling here. Guys are marking off milestones on blue print looking bar charts. I will charge until 20:30 UTC as Bob was kind enough to remind me. Sorry about that Bob. Besides, I need to be at the mission control room at 20:30 UTC. Folks, this is really exciting!!!

Every thing is still a go for launch.

73's DAve Cowdin, WD0HHU

CC: LAUNCH, NCS, ANS, PACLIST
Subj: LAUNCH,ANS,NCS,PACLIST

GREETINGS FROM KOUROU:

I was taken out to within 0.5 km of the launcher and I was able to take plenty of pictures. One thing I can say is that our MICROSAT logo really stood out in the crowd!

I have shut down the battery chargers per Bob McGwier's instructions. The following are the voltages and currents at 2030 UTC:

AMSAT-NA 10.90 V 140 mA
DOVE 10.80 V 145 mA
WEBER 10.95 V 150 mA
LUSAT 10.89 V 130 mA

So this is the status of the batteries.

The weather is very strange right now. It is cloudy, extremely humid outside. But so far there are no constraints to launch. According to the launch chronology we start 3rd stage fueling at T-04 hrs 5 minutes from launch. The show of security is very evident here right now. Lots of armed soldiers with automatic weapons running around outside right now.

73's WD0HHU

P.S. I will dump a status report before I run to the Jupiter Mission Control room.

Subj: 3RD STAGE FUELING BEGINS

GREETINGS:

The fueling of the 3rd stage has begun at t-4 hrs 5 minutes which was two minutes ago. It was raining a short time ago but it has stopped now.

They just gave a weather forcast and said that it still good for a launch and was certainly good to fuel the 3rd stage. So I will go to dinner in a short while and then it is off to Jupiter Mission Control Room.

Message-ID: <9001211056.AA18346@ucbvax.Berkeley.EDU>
Source record: 14081

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

from the files that I have:
(note: is the tm221 a 2M rig or a 220 rig? The first file makes it seem a 2M rig. So, this info may be defective!)

copied from packet:
From: N2EYR@WA2SNA
To: ALL@KD6TH
Subject: TM221.MOD

The following is a simple modification for the TM-221 rig:

1- Locate the control unit board (X53-3040-XX)
located behind the front panel.

2- Right below the channel select rotary switch and opposite the M.IN
Sw. you will find R24 and R25.(foil side)

3- Remove R25 for 142.00 thru 151.995 Mhz RX TX

4- Move R25 to space for R24 for 138.00 thru 154.000 Mhz TX RX
(Range will vary slightly from set to set)

TM321A Mars/cap mod
from WM8J msgID 2846_wa2rkn

To give the TM321 tx coverage from (142 0r 143, don't remember which) to 151.995 mhz, remove the top cover. Look for a loop of wire comming from the display area (the board with the CPU) and going right back. Cutting this wire and then doing a CPU reset is all you need to do. Takes about 2 minutes.

Be sure that the ends of the wire don't short to something.

435. Stock-Market Quote Transmissions

Newsgroup: rec.ham-radio
Date: 1990-01-21 04:58:11 UTC
From: liebchen@cs.utah.edu
Message-ID: <1990Jan20.215811.18908@hellgate.utah.edu>
Source record: 14084
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Does anyone know about the frequencies of online stock-market quote transmissions in the air. They're supposed to transmit on FM, but in order to cover some appreciable range I wouldn't expect them to go higher than 60MHz. The other question would be the signal modulation: I was wondering, if a 300/2400 modem with FSK-decoding might be able to pick up a usable signal from the audio-output of a tuned in scanner.

> reported that much earlier, if you are equiped. I think this claus is
> wrong! I am now fighting it, but will most likely fail. I can not under-

I hate to add to your misery, but I don't see much
justification for your fight. Your insurance policy is a
contract between you and your insurance company, and is
undoubtedly very specific about what losses are not covered
(all policies are). The time to read your policy is when
you obtain it, not when you need to make a claim.

Virtually all auto insurance policies today exclude losses
of scanners, two-way radios (CB, ham, or commerical) and
after-market sterios. The basic radio is usually excluded.
The reason is simply the extremely high losses on these
items, virtually everywhere in the country. Renters /
Homeowners policies vary, but I believe most exclude any of
the above which is permanently installed and/or runs off the
auto's batery (mine does). A Renter's may cover your
handheld if taken from your car, but I'd be prepared to
argue about what "runs off the battery" means -- does the
item have a 12V jack?

Another issue to be aware of is whether your policy pays
replacement cost, or purchase cost minus depriciation. If
it is replacement cost, it will be stated explicitly, and
will cost more. For example, if you bought a radio a few
years back for $500, it might cost $700 to repurchase today.
But if the insurance co decides that you had the radio for
half or 2/3 of its useful life, you will receive $250 or
$166 instead of the $700 you might be expecting. Know your
policy! Buy what you need, not what the insurance salesman
happens to be selling.

You can get coverage of amateur radio and similar gear by
either getting a rider (supplimental insurance) on an

existing policy (obviously for an incleased premium), or by getting insurance through the ARRL's program. The ARRL's insurance is quite attractive -- $1.25/yr per $100 of replacement cost coverage, $20 minimum. (Remember that you are trying to cover something which is unfortunately a prime theft target.) You state the replacement cost. You fill our a minimal form to obtain coverage, and send a check for the first year. You have to be an ARRL member, $20/yr, which also gets you QST. I understand they are very good about paying with little hassle. One issue to be aware of is that they require that you insure ALL your equiptment. Presumably, this is to average the risk between high risk mobile eqpt and much lower risk home eqpt, hence providing a more attractive cost/$100. They have no way of checking, but if you insure only your mobile station and then make a claim, they might question it. They do cover lightening damage, for those of you in areas where that's a consideration. They will optionally cover computers, another item which your Renter's or Homeowner's may short you on (look for a low maximum loss coverage on "office equitment".)

I'd like to hear comments from anyone who's had experience with ARRL claim payments -- were you happy? Also, my impression is that their rate is very competitive -- much better than I could get on a rider; has anyone found the opposite?

438. Microsat launch scrubbed

Newsgroup: rec.ham-radio
Date: 1990-01-21 06:39:40 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19230@bellcore.bellcore.com>
Source record: 14087

Saturday night's Microsat launch was scrubbed because of bad weather. A thunderstorm moved into the launch area and did not move out until after the 10 minute launch window closed.

The next attempt is scheduled for exactly 24 hours later, at 01:35 UTC Monday (Sunday evening US time).

The Arianespace TV coverage for Sunday evening will be on Spacenet 1, transponder 4. This is a change from what was used Saturday evening.

I had 1" conduit installed from my shack to the attic for fishing
wires in to the attic.

On my next house, I will have 1 1/2" or 2" conduit installed from the
shack to a roof vent so I can pull later-added cables from the shack to the
roof without having to battle the attic temperatures/crud ever again.

A varmint seal and an "inverted J" should keep out unwanted critters/moisture.

Mine didn't have this feature, but it was maybe 2-3 years ago. Give them
a call and ask to talk to their QA department and let them know about it.

The only problem I had was I missed the part about it taking 5-10 minutes
before it would display any time. I though I needed a better antenna to
get any action and ended up setting it aside for a few months...

Yes the audio on the Mic jack to too low for most tnc's, if you look it comes right off the DISC. I usually just run a wire back to the EXT SPK jack... besides it then kills the local audio as well...

I wonder if the TM-x31's have enough audio on the mic jack...
We have a bunch of them that have been in operation for 1-2 years at tower sites, and so far the only thing that has happened is that the pannel lights have burned out... they have moved lots of data...

ps. they are running ROSE X.25 Packet Switches, not digis...

>Steve Look ka9szw
>look@uicsrd.csrd.uiuc.edu
>----------

Current commercial practice is to insert the modulation at a low level
(milliwatt range) just after the rf exciter. A diode ring modulator is
generally used followed by a SAW filter for vestigal sideband filtering
and carrier is reinserted after the SAW filter. Remember that TV transmits
the full upper sideband+carrier and the first .2Mhz of the lower sideband.
This technique allows bandwidth conservation while allowing simple
envelope detectors to reliably recover sync.

High level modulators suffer from incidental phase modulation which is
very difficult to tame and the need for large water cooled filterplexers
to remove the lower sideband. Also it is much more difficult to get
good linearity and chroma to luminance delay characteristics with a
high level modulator. A box called a predistorter is needed. A predistorter
shapes the video waveform to compensate for the transfer characteristics
of the high level modulator and modulated rf stage. These boxes are both
difficult to build and tempermental to adjust.

If a cruddy mono bandwidth hog is your goal, use high level modulation
without a filterplexer as is done in certain commercially made equipment
sold for amateur tv. On the other hand, if you want high quality color
transmission using socially exceptable bandwidth, use low level modulation
with good filtering and a good linear amp.

I am a little happier to report: Comprehensive Insurance on your car (theft, fire damage, acts of God, etc) should cover the expense of the equipment lost!

I talked to an independent insurance agent friend of mine, and he handles over 60 insurance companies, and of these 60, only 3 would NOT cover it in the Comprehesive part. But then they STATE OUTRIGHT that it is not covered. He used to work with the insurance company I am with, and he states that the reason the company is trying to push this through the renters, is so that they can say no! They get bigger bonuses for saying no! But they can't say no to the Comprehensive! But, I was unaware of this at the time. I have a $100 deductable on renters (with REPLACEMENT COST - INCLUDING COST OF LIVING INCREASES (yes I finally read it!)), whereas I have a $0.00 deductable on the Comprehensive! They don't want to send me the $507.93, they will send me the $407.93 a bit easier!!!! So, I am gonna push them a bit!

Also: NOTICE: Anything "STORED" in your vehicle (not used) IS COVERED! All my stuff was either in the back bed (station wagon), or stored in a container in the front (a seperate container I keep for putting items in while I am not using them.) The reason the antennas aren't put in the storage area, is they are to large to fit. So, I have them on that technicallity also.

Also, I told them my equipment is not run off the battery (antennas run off the radio, along with the battery pack I had), so a lot of this is all technicallities that you can work around! So, keep your ears/eyes out on how to go around this, and get thing done right!

>I'd like to hear comments from anyone who's had experience
>with ARRL claim payments -- were you happy? Also, my
>impression is that their rate is very competitive -- much

With the 10m band really "hot" these days and due to space/budget limitations, I'd like to install a half wave vertical in my QTH. I'm consider three alternatives for feeding the vertical, and for each them of I have some questions and doubts I'd like to ask for some advice on:

1)A coaxial half-wave.

This antenna seems to be quite popular on 2m and above, although I've seen some CB models too. Basically its a half wave dipole built out of aluminum tubing with the coax line passing through the lower section and connecting in the middle of the dipole.

I actually built one, but I'm not so convinced with the results. First, the feedpoint impedance is expected to be closer to 75 ohm rather than 50, so SWR is expected to be 1.4-1.5 at best. I measured 1.7/1.8 at resonance (lower SWR frequency), enough to get the SWR limiter of my TS130S starting to limiting the output power. Of course I can use my antenna tuner and get a 1:1 SWR, but I would prefer a better "natural" match and avoid tuner losses and bandwidth compromises.

Questions:
1.1)Is it correct to connect the coax to the INNER face of the two dipole halves? I use aluminum tubing, 3/4" OD, split in the middle, with a PVC jacket covering the feed point +/- 3 feet above and below. This makes the dipole a single mechanical entity. The coax is then secured with flat-head screws and nuts to the inner face of each dipole half, ground braid to the lower half, central conductor to the upper half. The inner face connection allowed me to keep the PVC jacket unbroken).

Since the antenna seems to be too "silent" when compared with my half wave horizontal dipole, I started to fear that due to skin effect, the inner face of the tubing could actually be "shielded" by the outer face, much in the fashion of antenna currents induced on the outer face of a coax line feeding a balanced load.

1.2)An article on HAM RADIO about coax verticals pointed that the optimum height for a coax vertical is 1/2 wavelength, since then the antenna and its image are 1 full wavelength apart. How much is performance decreased by having the lower end of the antenna only a couple of feet above the roof, that is, the feedpoint slightly above 1/4 wavelength from the roof? (The article points out how much gain is ADDED by rising the feedpoint 1/2 wavelength, but it's not clear if I get LOSSES if the antenna is too low. I mean gain or loss referring a 1/4 wave vertical with an ideal ground system).

2)A 1/2 wave vertical, voltage fed with a tapped parallel tuned circuit at the bottom.

This method of feeding is recommended by Bill Orr in a past number of "Ham Radio". He describes a kind of coaxial tuned circuit, with a sort of "gamma match" for getting the low impedance tap for the coax. My question is:
To what extent is this antenna "ground independent"? I assume you need an RF low impedance point to connect the coax braid and the lower end of the tapped parallel tuned circuit. Does it means you need 1/4 wave radials? There are no radials nor other form of grounding in Bill's design? What am I missing?

3)A J-pole 1/2 wave vertical.

J-pole verticals are quite popular at VHF, and seems to me mechanically feasible at 10 meters. My questions are:

Is the current distribution in the J pole antenna different that in a coax or voltage fed vertical? Since the J-pole's lower end is at low Z, I expect to have the current maxima at both extremes, and the voltage maximum at the middle. Is that correct or am I missing something? If my assumption is correct, how do the elevation directivity and gain of this antenna compare with the other verticals I mentioned above? How sensitive is the J-Pole to height? (If you have a current maximum at the top, and the fed point is at ground level, then this current maximum and its image are 1 full wavelength apart, which is what we are looking for, right?)

I will very appreciate any comments, and thanks in advance.

I believe Stock-Market Quote Transmissions are broadcast via FM broadcast station SCA subcarriers. The two popular SCA frequencies currently in use are 67 KHz and 92 KHz, and frequency modulation (+/- 7.5 KHz deviation) is used.

The digital information is transmitted using 9600 bps PSK (I think).
Regency Electronics produces commercial "Quo-Trek" (?) receivers specifically for receiving these signals, demodulating them, and providing some sort of visual output of stock prices.

And all that (and MORE) information is safely tucked away in your FM radio!

...John...

In my area, Stock Quotations are sent as 4800 baud FSK data on an SCA subcarrier of a regular FM station. You will need to build an SCA detector, which in turn needs access to a wide-band (before de-emphasis) output from your HiFi FM tuner. [Alternate method: listen to the IF with a general coverage receiver. You can hear the SCA carriers at 10.7 + 62 KHz, +73 KHz, etc. I don't know exactly what SCA subcarrier frequency your station will use.]

>I was wondering, if a 300/2400 modem with FSK-decoding might be able
>to pick up a usable signal from the audio-output of a tuned in
>scanner.

No. The signal format is entirely different.
Also, the Stock Quotes are NOT transmitted in plain text here. You might need to figure out the coding scheme.

Does this include Amateur Electronic Supply? I notice that their catalog
lists a Hustler RM-11S. This is a 2 kw PEP resonator which is intended
for operation on 11 meters. I can't think of a legitimate purpose for this,
at least in this country. [They also list a 400 Watt one that I could
imagine using if I _needed_ 11 meter coverage.]

Of course, most CBers would think that it was not applicable, since they
don't put out PEP Watts. :-)

Perry Scott suggested restricting W1AW's digital mode bulletin transmissions
to "send RTTY, with local converters to 2mtr packet".

I assume he wants to restrict it to just Baudot only.

I am one of the packet OBS stations who gets the bulletins from W1AW and
puts them out on the packet network. There are problems with restricting
it to Baudot. When I started doing this, all I had was a C64 with
various AEA components. The bulletins come out during the day while I
am at work, so I need automatic means to receive them. I started using
my C64 on AMTOR FEC, because of the error correction and the fact that
noise between transmissions would not be copied to the small buffer
in my computer. This worked pretty well.

Now I am using a second computer, an AT clone with a PK232. The 232
has a squelch circuit, so I can copy the Baudot bulletins, and the
hard drive on the AT has plenty of room to copy noise all day. Now
the C64 serves as a backup copy.

The times that this really becomes useful is on Tuesday afternoons
(3:30pm local Seattle time, 2330 UTC) when they send the satellite
Keplerian elements. AMSAT sat users use feed this data into their
tracking programs, and it HAS to be right! So having the redundant
capability really helps in de-trashing these bulletins. Also for
other bulletins there are the times when someone is tuning up
on top of part of the Baudot transmission, but are gone by the time
that the FEC is transmitted. The ASCII bulletins are nice for when
I am here, because they are in mixed case, which looks nice on packet.

A few times I have received bulletins so trashed that I have tuned
into the CW bulletin to fill in the blanks!

I suspect that some stock-market quote services use SCA subcarriers on broadcast FM radio stations. These subcarriers use an FMed carrier at 67khz, which is added to the main program audio of the FM station, and this is then fed to the main FM excitor of the station. I guess you could try building a SCA demodulator, and connecting the output to a modem, or TNC? Being a pay service, it's probably scrambled.

N9ICD posted something about comprehensive auto insurance covering stolen radios STORED in the car.

I recently was told by my agent that I could not claim a loss for my IC2AT, HR2510, AEA keyer, paddle and VHF wattmeter stored under the seats of my car. I had comprehensive insurance. They said that if I had it mounted in the car, and had paid for having it covered, then I would have a claim. They told me to look into renter's household insurance, which I don't have. I wish I had the ARRL insurance.

Should I have pursued this further?

They are sent as a SCA subcarrier on an FM broadcast station. 88-108 Mhz.
Since it's a subscription system, there is probably some level of protection
in the form of custom modulation or encipherment.

My favorite method of listening to SCA signals is to take the cover off an
FM tuner, hook my Heathkit VLF converter into the input of the multiplex
stereo decoder chip, and tune around on the receiver fed by the VLF converter.
All sorts of stuff is out there, including some digital signals. This is in
the range of 57 to 95 Khz, for each FM station.

Warning, the #$%^& Electronics Communications Privacy Act has some restrictions
on listening to SCA signals.

I disagree with the policy of sending program guides. While VOA may not be oriented to American listeners, listening to VOA by Americans is still an important enough concept; though of us who are interested in understanding the foreign perspective of America need to listen to VOA among other things. A program guide is essential to this. I will call them up this week and ask for a program guide, offering to pay for legitimate costs. If they refuse, I will invoke "Freedom of Information"!

Unfortunately, Illinois has NO spectrum planning group. I've been thinking about trying to start one. It would be nice if the Illinois Repeater Association could do this, but they cannot fulfill the function as long as their constitution restricts membership to repeater owners. While I personally feel a repeater coordination group should consist of NON-owners as well as owners of repeaters, traditionally only repeater owners have shown the interest level. As to spectrum planning, however, the mere diversity of issues that must be addressed cannot allow for one group to dictate the matter.

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly
around the world. It is available for UNLIMITED distribution.

* SAREX NEWS *
==============
1990 is going to be a vintage year for amateur packet radio in space.
This month will see the launch of the four AMSAT Microsats plus two
UoSATs.

In late April one of our MDC area astronauts, Ron Parise, WA4SIR will
fly on the Shuttle Columbia in mission STS-35. Ron will be carrying
2-meter packet radio hardware with him -- a modified HK-21 TNC, a Motorola
hand-held transciever, a window-mounted antenna and a Grid lap-top computer.

The TNC will be carrying special software -- an updated version of the
SAREX "Robot" that would have flown in 1986 had the Challenger
disaster not occured.

The "Robot" software is an automatic QSO machine. After connecting to the
robot, you are given a serial number, and as soon as you acknowledge the
number, the Robot disconnects and enters the QSO into the log. As many as nine
simultaneous QSOs can be going on. If the robot hears you, whether or not
you make a full two-way QSO, that information is entered into a second log.

You and the world know immediately if you had a QSO or were heard, because
periodically the robot sends out beacons. A beacon addressed to QSL> lists
the two-way QSO's and the serial number, and a beacon adddressed to QRZ>
lists the stations heard.

In addition, the robot has an additional beacon (called the Metabeacon)
addressed to QST> which has up to 7 frames of up to 255 characters/frame
(i.e. about 1.7 kbytes). This is intended to serve as a longer general
information beacon into which Ron can put mission status information.

N2WX and I have worked hard to get a "beta" version of the flight TNC
software working, and we are ready to test it. The SAREX goodies are now
operating from here under the call W3IWI-5 (alias SAREX) on 145.050 MHz
using the same radio as the 145.05 W3IWI BBS port. The QST, QSL and QRZ
beacons fire every 5 minutes.

Please give the software a shot. Try to crash it! It is a lot better to make it die now than in flight!

73, Tom W3IWI

* VOYAGER NEWS *
==========
Voyager Mission Status Report
January 16, 1990

Voyager 1:

The spacecraft collected routine cruise science data throughout this period. A TLC test was performed on 01Jan90 and the X-band TWT was switched to the high-power mode on 02Jan. A high-rate UVS observation of omicron Andromedae on 03Jan and playback of Uranus photometric images on 04Jan were lost due to the continuing non-availability of DSS 63 (failed elevation bearing).

On 02Jan, the Bay 1 Heater was turned off and the X-Band TWT commanded to the high power mode in preparation for Playback #6.

Activities for this period included the collection on low-rate UVS data from the source omicron Andromedae, and low-rate F&P&W data throughout the week.

Voyager 2:

Routine cruise science data were collected throughout this period, although substantial amounts were lost or severely degraded due to the spacecraft's passage through superior conjunction. The minimum Sun-Earth-Probe angle (0.75 degrees) was attained on 02Jan90.

The collection of low-rate F&P&W data continued throughout this reporting period and two frames of PWS were recorded, one each on 21Dec89 and 27Dec89, for later playback. In addition, the scan-platform was slewed to the target plate on 15Dec89 and the UVS read-out mode was inhibited through 21Dec89. On 21Dec89 the read-out mode was enabled for a successful readout. Shortly thereafter, the read-out was inhibited again through 27Dec89 at which time the read-out was enabled for a second successful read-out.

The Scan Platform was pointed to a UVS dark sky position. Data were of poor quality from 01Jan through 03Jan. This was not unexpected, due to the low SEP angle of less than 2 degrees. There was a PRA POR on 04Jan90.

[From Ron Baalke - Jet Propulsion Lab - Pasadena, California]

* MUSES-A LAUNCH *
==========
On 16-Jan90, NASDA postponed the launch of MOS-1b until February 7, due to a needed replacement of an electronic device used to control the launcher's second stage.

From: karn@ka9q.bellcore.com
Message-ID: <19248@bellcore.bellcore.com>
Source record: 14115

The launch went off tonight as planned, and everything was on the money.
Successful separation of all seven payloads was confirmed. On the first
orbit, the ground station in Argentina successfully commanded on
the 437.125 MHz CW beacon on LUSAT; I heard it a few minutes later when
the spacecraft came above my horizon. At that time N4HY (also in New Jersey)
attempted to command on the main beacons but without success. Chances are
that the problem is on the ground, not on the satellites, so we're not
too worried. Other ground stations will have their turns on the next few
orbits.

Here's an initial element set derived from tracking during the first orbit:

Satellite: spot-2

> I believe that double-balanced hot-carrier-diode mixers are often
>followed by a stage of amplification to allow proper termination of
>the mixer. If these mixers are not terminated in a resistive load of
>near 50 ohms at all frequencies, their strong signal handling
>characteristics can be significantly compromised. It is not hard to
>build a post mixer amplifier that can handle larger signal levels than
>the mixer is capable of delivering without distortion.

Mini-Circuits sells a hybrid mixer module called the UNCL that contains a doubly-balanced diode mixer and low noise post amp in the same package. The post amp provides an output capable of driving the frequency dependant reactance of a crystal filter without upsetting the mixer. Mini-Circuits has a version of the UNCL that can take about +20 dBm without overloading, as I recall.

The reason manufacturers don't use them is cost: about $20.00 each for small quantities. This doesn't sound like much for a kilobuck radio but thats the way life is. I work occasionally for a consumer electronics manufacturer and I have given all the arguments for using exotic components and heard all the reasons why I can't: basically cost and availability.

I have often thought it would be an interesting project to build a single conversion receiver with a 9 MHz IF with these mixers and the Plessey IF chips that require no tuned circuits. With one of the new 50 MHz direct digital synthesizer IC's from Qualcomm or Stanford Telecom, a very simple and robust HF receiver could be built. I have most of the parts...but not the time, it seems.

These mixers and synthesizers are advertised in "RF Design" and "Microwave Journal", a couple of excellent trade journals for radio designers. They're free, too.

CC: LAUNCH, PACLIST
Subj: LAUNCH DAY STATUS RPT #4

LAUNCH DAY STATUS REPORT #4, SECOND ATTEMPT! 21:35 UTC

Greetings from Kourou:

The fueling of the 3rd stage has stared and that is proceeding well. The count down clock is ticking away and things are once again getting busy here right now. Now for the weather. It looks a hell of lot better tonight at this point than it did last night. High altitude clouds with some lower ceiling clouds around. From the TV monitor in the blockhouse it doesn't appear to be raining. But it is not just pure rain that will stop a launch. It is big thunderstorms that will do it. I can see the sun in a few places and it would almost be a nice sunset. But we still have to consider that this is the rainy season for Fr. Guiana. I talked with one of the Arianespace payload managers and he says that for launches with such small windows, they may schedule them for the summer when the weather is not such a problem.

The battery chargers were switch off about an hour ago and here are the values:

AMSAT DOVE WEBER LUSAT
10.87 V 10.82 V 10.87 V 10.87
140 mA 135 mA 160 mA 120 mA

I will stick around the blockhouse to see how the operations are going because it is really in the blockhouse that you get the straight information. These people know what is happening long before the Jupiter Mission Control people.

Subj: DOVE

Courtney, None of the people I talked to copied anything from DOVE. So
no joy on this. Almost all of them did copy the LUSAT beacon and had
basically the same report as I gave you--good signal, slow fades, etc.
Good luck to all on the West Coast command efforts!

73-- Bruce

Subj: LUSAT psk turned on !

The LUSAT PSK beacon was commanded by by NK6K @ W6TRW at around 5:13 utc.

More info later... We were interviewed by the local CBS AM affiliate,
so that's why this message is late.

More later.

ps, weber turned on webersat, we got lusat. I'll try pacsat next pass.

NK6K.

Subj: Report

Congratulations on successfully commanding LUSAT, WEBERSAT, and
PACSAT (we didn't get a chance to listen for DOVE)!

General observations:

LOS occurred at this QTH at 05:20:19 UTC about 9 seconds BEFORE
the predicted LOS of 05:20:28

Signal strengths were excellent. Was able to get a good psk
modem lock on all signals. Polarization changes between RHCP and
LHCP were very noticeable. Rate of change was "relatively" slow
(sorry I don't have better data, but I had my hands "full"!).

Did anyone get Bob's decoding program to work? I had NO JOY with
it (either version). Two other individuals who I spoke with

after orbit #2 also had the same problem. I did check to see if the TNC/PSK modem was working and the data, using PROCOMM, looked good. Thus, it appears to me the computer was receiving the "proper" data. Unfortunate, all three of us were running at 4800 bps between the TNC and computers (yes, we did execute the program using TLMDC COM1:4800,8,1 :-)). Will try the default 9600 setting tomorrow. Would appreciate reports on this.

Again, congratulations to all--the satellite design team, software development team, fabrication team, launch team, command station team, and anyone else I forgot for a job WELL DONE!

73 -- Bruce WB9ANQ

P.S. I'm beginning to wonder if I've lost my mind! Was PACSAT finally commanded on on orbit 2. I could have staked my soul on having heard it! Was I excited?

Subj: passdata

Had good strong signals here on WEBER, LUSAT and PACSAT PSK. Were only able to get a lock on LUSAT for about the last minute of the pas, but thanks to K0RZ, we have about 15 good TLM block from each bird for
that pass. Have a small
but in the Mac TLM decode program, so we only have partial blocks decoded, but expect to have that fixed by tomorrow night. Will record what we can of PACSAT during the third pass, though we have only a 5 degree elevation, and the mountains take up about 3 of that. Congradulations to all. The Boulder gang that was hear hosted the bubbly when we heard the LU beacon and there were whoops of joy with the first PSK signal that blew the speaker off the shelf! 73 Jim

Subj: TLM in Detroit

Tim, N8DUY has a 790 and reports that its doppler correction feature made copying LUSAT & WEBER a breeze here in Detroit. I too look forward to DOVE and will be capturing TLM tomorrow if it is commanded on. I'll be monitoring all passes.

Subj: LUSAT CW Beacon LOS time

FYI. LOS time for the LUSAT CW beacon at my qth was 03:41:55 UTC. Predicted time, based on the element set was 03:41:56. Agree with N4HY's comments; looks like the element set is right on the money!

Dear Junior,
Let me say best wishes good helth to you and yours in 1990!
Here in Moscow we are getting ready for Microsats and UoSAT receive. Many schoolboys are interesting DOVE bird. I think it will most popular in USSR. All satellite people held "crossed fingers".
RS-14 is in progress. Also Rudak-2 system. Next month we are going to integrate all equipment and bring to the S/C.
Hope to meet you in Guildford. 73, Leo "CR".

To: W3IWI K8OCL N4BF N4HY KO5I ... AMSAT ....

Hello AMSAT-NA friends,
10 hours to launch V-35 now. We are waiting for this exiting event with great iterest. I try taking part in HFnet WA3NAN. We hope all new OSCARs will be OK. I'm sorry, I'm leaving Moscow 21 January and coming back 26 January.I can't hear them directly this days.We going to small town Molodechno about 800km west from Moscow. We are installing and testing RUDAK-2 module with RS14 transponder And other news is PR permission in USSR starting 1 march 1990 for all first class licenced HAMs.
Thomas, please pass my great thank to Dr. John Champa, K8OCL for pleasant parsel and greetings from AMSAT-U people.
Our regards to all ANSAT-NA people from Moscow friends.

Subj: THANKS

Hi Dave.

Obviously, hearty congratulations are in order to all the Amsat people who made the launch a reality and for the superb presentation of the Amsat Launch Information Network last night by Doug and the whole team. But I just wanted to tell you that I thouroughly enjoyed and appreciated your Launch Day Status Reports. Aside from providing necessary operational data, you truly succeeded in providing the "color" and feeling of excitement that was in the air at Kourou. Thanks for all your efforts.

Subj: Microsat progress

On the pass at 05:05 UTC over the western US we were able to
get Webersat turned on. We now have to satellites active,
LUSAT in the CW beacon mode and Weber. N4HY was able to
capture a few telemetry frames from his QTH. The command team
will continue to work the issue. Harold will have one more
pass this evening...We're getting there. 73 Doug

Subj: Webersat works!

Looks like Webersat survived the launch. In the brief 3 degree elevation pass
I was able to copy a few frames after Harold kicked it. I find it amazing to
note that the time-of-day clock was within a few seconds given it was set
38 days ago!

I observed some fairly deep fades here -- fading rate seemed to be about
30 seconds. The fades played havoc with my trying to keep in lock! -- Tom

Subj: Some more Webersat TLM

Whoops -- because I had two different capture buffers running, my earlier
message missed a few frames I grabbed. These should be appended to the
START of the TLM I just posted. It's good to see that the batteries are in
such good shape and that the temp is stabilizing.

Due to a trip I had to make today, I was not fully prepared, I
loosely coupled the signal to the TAPR PSK modem for tuning
indication, while recording with a walkman, no mike, headphones stuck
in the mike jack, laid on top of the radio! I carried walkman and
modem back to my shop, and connected it all together with a TNC and
computer, played the tape back and that's what I got! What a modem!
I'd have gotten much more if I'd been more ready! I wasn't too smooth
on the freq knob!

Even at 1 and 2 degrees up, signals were great! What a satellite!
Great job, congrats to all involved!

464. SAREX 1990

Newsgroup: rec.ham-radio
Date: 1990-01-22 09:14:57 UTC
From: jlulejia@jarthur.Claremont.EDU
Message-ID: <3887@jarthur.Claremont.EDU>
Source record: 14119

I am curious what the latest information on SAREX is.
Primarily, I am concerned with the type of orbit the Shuttle
will be flying. Is it going to be a low orbit, which will
restrict most of us in the higher latitudes, or will it be a
higher orbit, similiar to the last one we worked with
back in 1985? Also, will there be any SSTV on this
flight or just packet?

Thanks you very much!

465. VOA Available in the US

Newsgroup: rec.ham-radio
Date: 1990-01-22 13:14:05 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9001221314.AA02704@cmr.ncsl.nist.gov>
Source record: 14120

It seems to me that I recently saw that someone has added the VOA to their cable audio services. I think it was C-Span. If I also remember correctly, they used some version of Freedom of Information to get access.

As background info, C-Span, now offers two audio-only services in addition to the US House and Senate proceedings. The first is a composite of selections from various international broadcasting stations - non-US, but this might also include VOA, and the second which is the BBC World Service, intact. They require that cable systems use either both services, or only the first, prohibiting use of ONLY BBC!

The local phone book lists C-Span's phone number as 202-737-3220 - or contact your local cable system. Dish owners can doubtless find these as extra audio subcarriers on the C-Span transponders.

466. Stock-Market Quote Transmissions

Newsgroup: rec.ham-radio
Date: 1990-01-22 13:41:44 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <9001221341.AB00038@adam.DG.COM>
Source record: 14121

CEO summary:
I've done a bit of research on this subject & Have discovered that in Boston, at least, they're on a SCA-like subcarrier of about 90 Khz on WROR, which is at 98.5 Mhz (I may have the call letters wrong but the frequency's correct). There's a company called DataRX which advertises in "Nuts and Volts" (free at most hamfests) which sells software and basic hardware to decode the transmissions. Not too hard, really, since the data is simple FSK at 4800 baud & can be detected with a PLL set to the subcarrier frequency attached to the detector of a standard FM radio. DataRX sells a board & software for $270 which includes a TDA7000 FM receiver, filters & a XR2211 FSK decoder chip. They're at (303)-223-2120,
DataRX
111 E. Drake Rd. Suite 7041
Fort Collins, CO 80525
They make all kinds of disclaimers about how their stuff is for educational use only and what you do with it is up to you, etc. You will have to "descramble" the transmissions, since the way the quote companies keep non-paying (former) customers from getting the information is to XOR the characters with some constant or scramble the bit ordering or something else like that.

467. Mixers (cont's...)

Newsgroup: rec.ham-radio

Source record: 14122

Yes i agree with the comment that the diode mixer needs accurately
matched source and sink loads for proper operation. If an active device
is used as an impedance-matcher between the mixer and the filter, then it
should have the widest possible dynamic range (and the lowest possible
noise figure). I favor the use of a power-FET in grounded-gate configuration.
Something like a CP651, passing 20 or 30mA drain current, will have a
reasonable chance of avoiding non-linearity.
As in all these things, design depends on what you want to do with the
finished article. Low noise-figure is essential on 10 meters, but
less important than good dynamic range/intermod. resistance is on 7MHz
(where us Europeans often have the megawatts-and-rhombics of Radio
Tirana intruding into an 'exclusive amateur' allocation!).
Another thing to consider is good input filtering. The use of switched
bandpass filters (one per band) is to my way of thinking, less elegant
than a manually-peaked 'preselect' control. I guess the switched-filter
approach is easier to implement for mass-market applications than the
aligning/tracking of 3 or 4 signal-frequency tuned-circuits for each band.
Also, the use of diode switches to select antenna filter circuits is at odds to
the idea of keeping non-linear devices out of the signal path. A nice ceramic
rotary switch is likely to be less lossy and more linear.
And finally, remember that 'commutative' mixers like double-balanced diodes
should be fed with their l.o. signal as a square wave to obtain best
performance. This can be achieved using E.C.L. signal-conditioning
chips or a hard-driven pair of power transistors (you'll need these
in any case to get the power needed for a switching diode mixer - some of the
mixer-drive circuits i have seen could qualify as QRP transmitters...!)

I admit to being fairly removed from the epicenter of the recent
quake, living as I do in Santa Rosa, but we were close enought
that I lost water out of the swimming pool and so forth. I was
outside and *watched* my tower, a 68 foot Rohn 25 tiltover, during
the quake. My habit during earthquakes is to look for something
hanging, a lamp when I'm inside, or power poles/towers if I'm
outside to see what is going on when. I was standing watching my
7 year old trying to stay on her bicycle and couldn't figure out
why the ground was too close to me on both sides (like I was falling
but wasn't). I turned and the first thing I saw in the air on the
way to scanning for the tower was the electric mains drop from the
street doing a 10 foot or so peak to peak "jump rope". The tower,
which is guyed at 35 and 65 feet was wobbling about +- 15 degrees
but all the guys seemed to stay tight and yet not snap.
It's hard to guess what it would have looked like had I been
closer to the epricenter but my experience with precious earthquakes,
like October 1970 which devastated a good part of downtown Santa Rosa,
is that vertical towers and poles (light standards) do a lot of
swaying but come through pretty well.

Source record: 14124

I have use a bottom fet half-wave vertical (Cushcraft R3) on 10-15-20m with outstanding results. I have operated it with the bottom near the top of the house, just slightly below normally. I noticed no problems. I have also operated with the bottom on the ground and the top leaning against a tree. It worked just fine like that also. The bottom feed gives you a stronger mechanical construction, but is harder to match. The matching circuit is touchy and requires frequent adjustment if you use a simple parallel LC circuit. The Cushcraft R4 and R5 use something more sophisticated so it dosen
't have to be tuned. I don't know what it is.

I have also used a J on 2 meters. It has consistently worked better than any other HT type antenna I have tried. It also can be built quite strong mechanically, and would probably not require any adjustments for matching through major portions of the 10m band. If you have the height etc., I would recommend the J.

From: glenne@hpnmdla.HP.COM
Message-ID: <1250117@hpnmdla.HP.COM>
Source record: 14125

I would suggest a 4-6 foot dish, all else being equal. A yagi, or even a pair of phased helices would no doubt work but are higher q structures, particularly the yagi. Dishes are extremely forgiving and if you can come up with an old TVRO one or similar will probably give more immediate results.
From what little I've seen of published results I suspect that a 6 foot dish and even a crummy MAR-6 MMIC front end at 3 dB or so NF will probably work pretty well. Putting a GaAs FET in would no doubt pick up a few dB more of C/N.

>I had it mounted in the car, and had paid for having it covered, then
>I would have a claim. They told me to look into renter's household
>insurance, which I don't have. I wish I had the ARRL insurance.
>
>Should I have pursued this further?

Yes, pursue it farther. Unless specifically stated that it's not covered,
I guess you can get it covered. I talked with an independent agent, and
he stated that the coverage is for THEFT!!! Theft of articles in the car
is included with this!!! He told me to find out why they are saying no!
If they can QUOTE from the policy, then they can get you, if they can not,
well you have them over a barrel! I have been working with the insurance
agent, and calims dept. I now found out, I might get more back if I use
the renters insurance, as I have "cost of living increase/replacement
garantee value" on the policy! So my stuff that went up in price might
over run the cost of the deductible, which is $100. My comprehensive is
$0.00, so I'd get "what I paid for" on the items. It's kinda a tough
decission on what I prefer the rates going up on! Actually, if the
Renters insurance went up a bit, it couldn't be a lot, whereas the
vehicle insurance I could see making a large climb! So, it's again a
choice I have to make! But, if it happen a short time ago, try to tell them
you believe it's covered, and until they can prove otherwise, you might win!

> The usage of dual-gate FETs, often in single-ended, unbalanced
> configurations, seems commonplace.

The usage of dual gate FETs has several advantages:

1. Higher conversion gain over single gate devices as the non-linearities
of the second gate can be taken advantage of
2. a 20dB inherent LO to RF isolation
3. multioctave bandwidths possible

A dual gate FET mixer in a double balanced or image rejection configuration provides excellent performance. I agree that the use in a single ended or unbalanced configuration may lead to some problems, but don't blame this on the FET.

> Conversion gain is the last thing you should expect in a mixer.

I disagree with this statement. In some applications, you desire conversion gain. A mixer gain can offset a higher mixer noise figure to provide an overall lower noise figure. Recall:

F(total) = F(stage 1) + {F(stage2) - 1} / (gain of stage 1)

The noise figure of the second stage is reduced by the gain of the first stage. If the gain of the first stage is a loss (G < 1), then the noise figure of the second stage (and overall) is increased.

There are cases when a mixer conversion loss can result in an overall increase in the dynamic range of the receiver, however. If the higher D.R. is desired, then perhaps a diode mixer, with the resultant loss, may be applied.

The point here is that conversion gain may be desirable depending on the requirements of the receiver.

> Gain before the filter is the last thing you want.

Not necessarily, especially for VHF --> microwave applications!

475. Computer control of ICOM R-7000

Newsgroup: rec.ham-radio
Date: 1990-01-22 20:38:55 UTC
From: dennis@tfsg.UUCP
Message-ID: <589@tfsg.UUCP>
Source record: 13980
Cross-posted to: rec.radio.shortwave,rec.ham-radio

<>

Has anyone out there attempted to use the computer interface that comes with the ICOM R-7000? I am refering to the "REMOTE" jack on the back of the radio. It is described briefly on page 13 of the R-7000 instruction manual. I have some questions for those of you in-the-know:

The instruction manual on page 13 (section 4-7) says, "Receiver control is performed serially in the IC-R7000 by the advanced ICOM CI-V Communication Interface System. Operation is possible by installing a voltage level converter with a personal computer that has an RS-232C serial port."

Then it gives a schematic diagram of a circuit that is to be inserted between the REMOTE jack connection on the back of the R-7000 and the serial port of the PC. My questions are:

1) What is the circuit for? Is it necessary? Can I just connect the REMOTE jack directly to the serial port of my PC without using this circuit?

2) Is this circuit described on page 13, section 4-7 available in a completed (already built and ready to use) form? If not, how difficult is it to make? Are there any special precautions I should be aware of if I attempt this myself?

3) What are the control codes used by the R-7000 for computer control? Neither the instruction manual nor the service manual explains what the codes are that the software would need to send through the port.

I know there are commercially-available packages that provide computer control of the ICOM R-7000 (and other receivers), but I thought it would be a fun project to develop one from scratch, customized to my requirements. Needless to say, my knowledge of hardware/communications is lacking, but once I can get my PC to communicate with the radio it should be easy from that point on.

I'd really appreciate some help from anyone who has attempted to do this!

Hi,

Did anyone out there save any of the articles on creating
good earth grounds to hook up to radio equipment.
I know this subject has been discussed before and I don't
want to bring it up again on the net. If anyone has these articles,
or has suggestions, could you please send them to me.

I don't have a copper water pipe handy to my station.
I have questions such as:

1. What kind of rods to drive into the earth?

2. How many?

3. How deep?

4. Is there any way to test how good a ground you have made?

Thanks,

Jon

Message-ID: <5710005@hpcvra.CV.HP.COM>
Source record: 13984

I have a question for all the radio experts on "not so old radios".

I just picked up a DAVCO DR-30 receiver. It looks like somebody
put a lot of work into making it a battery operated receiver
with a loop antenna also mounted on the back.

Question: since the batteries where not in the unit, what power supply
requirements exist for this rig. (I have no intention of going battery
operation for this). I can figure out the polarities.
This is a solid state rig about 5"x5"x6" with an analog front panel
and covers 3.5, 7 ..... 27??, 50 MHz and also has to crystal locations
to operate on 26MHz and 53 MHz.

Question: does anyone have any knowledge of possible origins of this rig?
Is it aircraft equipment.

At a loss..... I would sure be interested in a schematic (HI HI)
if anyone just happens to have one.....

Thank You

Greg May KB4OX (in 7 land)

Congratulations to the AMSAT groups in many countries who made this feat possible! And thanks to AMSAT-NA for the excellent network they put together so that everyone could follow the action firsthand. It was really fun listening to the reports during the launch and during the first attempts to turn on the birds.

CNN carried a brief story about the Ariane launch last night, including an almost-accurate mention of the Microsats and UOSATS. (They said "at least four smaller satellites, one of which, called PACSAT, was built entirely by volunteers to enhance ham radio communications." Well, *all* of the six satellites besides SPOT were built by volunteers for ham radio and related purposes, but it was at least a sin of omission and not commission.)

Any news on the UOSATS??

Patty

I know how USAA does it. I think. :-) If the radio was installed like your stereo they will cover the loss. If it's slung under the dash (like my lil' 2m rig) they won't. Permanently installed is how they call it. As I read it, if my pickup should be totaled, they'll take the stereo (its part of the truck) but not the 2m (it's not part).

This reminds me of a friend who owned an RX-7 and a moped. The moped was stolen from his drive way. He considered telling the insurance people the moped was in the RX-7. I think we talked him out of that. Aggies.

Bob, N5GNA

P.S. Before you W5AC types take offense I am a graduate of the aforementioned school.

482. DOVE Satellite Downlink Sample

Newsgroup: rec.ham-radio

DOVE is a brand new OSCAR satellite that transmits telemetry on 145.825 MHz
using AX.25 protocol.

I just had a chance to copy some of DOVE's telemetry. During a 14 minute pass,
I copied 289 packet frames, or about 31 kilobytes of data. Here's just a SAMPLE
of what I copied, only about 26 hours after launch:

```
DOVE-1>TLM <UI>:
00:58 01:59 02:88 03:32 04:58 05:58 06:6D 07:3F 08:6C 09:60 0A:A1

Subj: UOSAT-3/4 REPORT 001

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 ACTIVATED

1250 UTC 22 January 1990

The UoSAT-3 and UoSAT-4 were both successfully commanded ON by the UoSAT Control station in Guildford this morning. On the 0900 UTC pass, the 435.120 MHz transmitter on UoSAT-4 was enabled and the satellite started transmitting engineering telemetry. UoSAT-3 was first commanded on the 1030 UTC pass. Its downlink is on 435.070 MHz. Further telemetry was received on the 1200 UTC pass. The downlinks are running at 50% duty cycle, currently 1 minute on and 1 minute off; this may be changed to 10 minutes on 10 minutes off during the 1400 UTC pass.

During the first days of operation, the two satellites will transmit several different data formats. These will all be

asynchronous bytes sent at 1200 bits/second, using AFSK-FM modulation. The data can be demodulated by any UoSAT-1/2 decoder connected to a 435-MHz FM receiver. Unlike UoSAT-2, which uses ASCII characters for most of its data formats, much of the demodulated data from the new satellites BINARY, and not printable ASCII. This data will be coming from one of two onboard sources: the dedicated hardware telemetry system, or the 1802 onboard computer operating system (known as the DIARY).

The dedicated hardware telemetry system is built around a custom-designed Very-Large-Scale Integrated Circuit (VLSI) manufactured especially for the UoSAT-3 and -4 satellites. This telemetry system is independent of all onboard computers, and provides UoSAT engineers with a simple way to monitor the health of the satellite. Telemetry is transmitted by the VLSI system in 10-byte "packets", each beginning with the bytes FF FF (hexidecimal). The VLSI system should only be in use for a few more orbits, so we will not publish the packet format at this time; if it is used for longer than expected, more detailed information will be distributed.

As soon as possible, we will load the FORTH operating system - DIARY - to the primary onboard computers on the satellites. The DIARY will allow us to begin more complex operations, such as whole-orbit-data collections, initial attitude determination, and deployment of the gravity-gradient boom. When the FORTH DIARY has been loaded, printable ASCII data (including a news bulletin) will be mixed with binary data formats.

Anyone who can get a BINARY logs of data from UoSAT-3 (OSCAR-14) or UoSAT-4 (OSCAR-15) on IBM disks is encouraged to send them to the UoSAT Team, The

University of Surrey, Guildford, SURREY, GU2 5XH, United Kingdom. Further information, including descriptions of the DIARY data formats, will follow.

Jeff Ward (G0/K8KA).

Subj: CORRECTION

Re my previous message: the 5 second correction to the mean motion should be added, not subtracted; this results in a mean motion of 14.28575, not 14.2841. A corrected version of the text follows:

CORRECTED

Radio observations taken of DOVE during Rev. 14 averaged 3 min. 10 sec. early compared with Bob's unmodified elset derived last night from Arianespace info. My suggested modification following Rev. 10 this morning, that we leave the epoch time alone at 22 days 1 hour 52 min 7 sec but change the mean motion to 14.28492, came out within 5 seconds of my Rev. 14 observation. To fine-tune it a little more, I suggest that we use 14.28575; that should get it right on.

Hope this helps someone until we get better data.

Subj: TLMDC does WORK!

SUCCESS AT LAST!

After a long battle this evening, while all the time questioning my sanity, state-of-being, and what life is all about, I overcame the problems I was having in getting Bob's TLMDC software package to run.

Yes Bob, I was running MBBIOS last night and I did use a communications program to verify the TNC was sending the proper data. Everything looked a-ok, but no joy in getting the program to do a darn thing at all--not even trash on the screen!

This evening I started everything all over again--verifying data quality/format etc. Then I tried it on my old 4.7 MHz XT clone--data appeared. Ok, why and what next? Then the light came on (at last--it took far too long ;-))! THOSE DAMN

TSRs!!!!!

Yes, that was the problem. I slowly began getting rid of TSRs.
First the mouse driver--I started to get garbage, but it was
something. I than purged a virus checking TSR and low and
behold--TLMDC worked like a dream! There it was, REAL GOOD DATA!
AT LAST :-D

BOTTOM LINE: TSRs bit me where it hurts. I should have thought
of them, but with the excitement, etc that thought never crossed
my mind. And nothing was interfering with the operation of the
comm program--hex dumps were perfect! So, I've purged all TSRs
and advised the other gents who had problems last night to do the
same, see what happens, and start adding them back until they
find out what causes the problem.

Bob--any documented problems with MicroSoft C 5.1 and TSRs?

73 all and thanks for the suggestions -- Bruce

Subj: EDAC Errors

Based on the pre-launch value of the EDAC error counter, we have
already experienced a few single event upsets (SEUs) on each of the
microsats. This is normal and to be expected. The counter for LUSAT
shows many errors, this is more likely to have been a single correctable
error in executable code rather than many individual SEUs.

Each time that the hardware reads a byte containing a bit which was
corrupted by a high energy particle, the correction process ticks into
the EDAC error counter. If the bad byte is read, corrected by hardware,
then re-written by the program, it will not be corrected the next time
it is read. The "wash" routine goes thru each of the 256k of hardware
protected bytes, reading and re-writing all of memory each 4.3 minutes.
As a bad byte is read, it is corrected, counted, and re-written/fixed.
This gets one count per error.

If the error is in a part of the program or data that is read by a process
other than the wash program, an error will occur each time it is read, until
it is fixed by the wash. This results in several counts per error rather
than just one. I suspect that is what happened to LUSAT.

Other items:

The IR sensors are in their most sensitive setting (the default). We'll
probably crank in the log scale in the next few passes. However, there
already can be a case made for seeing the sun and the earth,
when the +Z face (with the IR sensor) is getting current, the IR is 255
counts, when -Z is getting sun and +Z is not, the count is in the 21 thru
146 range. As this data was taken near local noon, chances are good
the +Z was earth pointing (if -Z was sun pointing). When both Zs are
dark, the IR is 0.

Have fun with the telemetry. The more complex software uploading begins
tonite.

Subj: Stuff

Independently, I empirically derived 14.2856 for a new mean motion. Just goes
to show you Ray, great minds think alike. After making that change, the passes
all day long were within seconds. This lowers us by over 20 km. Not the end
of the world but not great.

We are seeing lots of EDAC counts in this dense memory and the wash routines
are saving our buns. When an SEU happens in program intense space, the
counter really moves before the Wash routine gets to it. We never see
the edac counter move here. I would be MOST interested in getting data
from the Argentinians.

I bet that most of the SEU's occur over the SOuth Atlantic.

Bob

From: TCLARK
To: amsat
Subj: A little PR

Here is a packet bulletin I started circulating to the masses. If you post
it locally, please preserve the BID ----

SB ALL@AMSAT < W3IWI $34842_W3IWI
Listen to the new Microsats
R:900123/0535z 34842@W3IWI.MD.USA [Balto/Wash MD/DC/VA/DE] Z:21029

As you have probably heard, six new amateur satellites were launched on
schedule Sunday night, Jan.21 (about 01:36z on 1/22) following a one day
delay because of bad weather at Kourou. With that launch we now have
OSCAR-19 (and 14, 15, 16, 17 and 18) all in orbit.

All four Microsats (-16 thru -19) and both UoSATs (-14 and -15) have now all
been brought to life and all indications are that everything is nominal.

Of the Microsats, three (PACSAT, LUSAT and WEBERSAT) are transmitting 1200BPS
PSK packet telemetry in the 437 MHz range. LUSAT is also transmitting CW on
437.125 MHz.

The fourth Microsat, DOVE has a 2M downlink on 145.825 which later will be transmitting synthesized voice, but now it is sending ordinary 1200 BPS AFSK-FM packet telemetry which anyone can copy with a "stock" TNC and 2M FM radio -- no special equipment required! On the last pass I was even able to hear DOVE well on my HT with a rubber duckie when it was 2800 km away, about 5 degrees above the horizon. On the radio I normally use for the W3IWI PBBS, DOVE is as loud as many local area packet users. DOVE's 2 watt 2M xmtr puts out a potent signal!

All 6 spacecraft are in essentially the same sun synchronous orbit. In the northern hemisphere you will get two or three evening passes in a window centered on 10PM local time, and two or three morning passes centered on 11 AM local time -- all the passes you can hear will be between plus/minus two hours from these times.

So if you want to copy the packet signals from DOVE flying 800 km up, just crank your 2M FM rig to 145.825 and leave your TNC in the monitor mode. It will transmit for a couple of minutes and then stop for 30 seconds. To decode the telemetry from any of these satellites, watch the ALL@AMSAT packet bulletins distributed by AMSAT for more details.

And there's more to come -- the Japanese plan to launch OSCAR-20 next month, and astronaut Ron Parise, WA4SIR will have packet radio hardware onboard the next flight of the Shuttle Columbia (STS-35) in April.

If you are proud of these amateur achievements, please contact AMSAT for more information on how YOU can participate in these amateur space activities.

485. Re: Stock-Market Quote Transmissions

Newsgroup: rec.ham-radio
Date: 1990-01-23 08:01:47 UTC
From: die@cpoint.UUCP
Message-ID: <3648@cpoint.UUCP>
Source record: 13990
Cross-posted to: rec.ham-radio,rec.radio.shortwave

In article <1990Jan20.215811.18908@hellgate.utah.edu> liebchen@cs.utah.edu (Armin Liebchen) writes:
>Does anyone know about the frequencies of online stock-market quote
>transmissions in the air. They're supposed to transmit on FM, but in
>order to cover some appreciable range I wouldn't expect them to go
>higher than 60MHz.

All of these services use SCA subcarriers on commercial FM stations to transmit the stock quote information. They are thus using frequencies between 88-108 mhz, but at the very high effective radiated powers of broadcast FM stations the signals are receivable with a decent antenna for distances of up to 100-150 or more miles away from the station.

The two most popular services transmit FSK subcarriers with about 8-10 khz of deviation on either 67 khz or 92 khz. Usually they choose a strong (50kw) FM station with a good signal over a wide area (good antenna site). Because of the need for good coverage these stations tend to be the top (and usually rock) stations in their area. Both major services have many (upwards of 100 I believe) stations transmitting their data streams in various markets throughout the US.

Modulation is direct NRZ FSK by encrypted ASCII data streams at 4800 or 9600 baud. Transmission is 8 bits plus parity or 8 bits with no parity asynchronous with 1 stop bit. The information is encrypted with relatively simple ciphers that can be broken by amateurs (nothing as hairy as DES is currently used). Under the encryption, the information will be found to have a regular format suitable for machine parsing rather than easy direct human readiblity.

There are also a number of other services that transmit streams of information (including wire services and the like) on SCA subcarriers both with FSK and PSK modulations and a 24kbs AM/VSB mode. Some, like the latter 24 kbs service use elaborate Reed Solomon or BCH forward error correcting codes, and transmit packetized data time division multiplexed on a packet by packet basis so that one data stream can carry many different information streams.

The stock quote signals can be received by simple homebrew PLL FSK decoders if the FM station signal is strong, but the software hacker unwilling to cobble together a hardware FSK demod can always purchase a Lotus Signal kit and hack the software. Lotus Signal kits come with a FM tuner/FSK receiver on an AT plug in board. The tuner and FSK unit are under software control and can be set to receive all available FSK transmissions with a little hackery.

Obviously, receiving such signals and extracting the information
therein may well constitute the crime of "signal theft" or "theft of
services". It seems clear that the ECPA outlaws unauthorized reception of
scrambled or encrypted transmissions, and that if the situation with satellite
TV is any guide the Feds might prosecute. Chances are very good that they would
prosecute anybody who made a business of selling equipment to support
such piracy, private individuals experimenting in their basements for fun are
much less likely to be targeted although they are probably still commiting
at least a technical crime.

I am working on one right now. I expect to be done in less than a
month. I suggest using an IBM PC, with a little extra misc. hardware.
I will use the speaker output through a low pass filter for CW id and
other informative messages. I will use standard serial and parallel
ports for input and output. Everything will be controlled by software.

A video monitor will not be required; a video card and a keyboard might
be. No hard disk will be required, a floppy controller and one floppy
drive will be used. The system will basically consist of case,
motherboard, power supply, floppy controller and drive, serial/parallel
card with real time clock, keyboard, and monitor (which may be removed
after bootup).

Advantages:
I get exactly what I want, not what the manufacturers think I
want.

Everything is easily changed as desired/required.

Controller is easily extended to more capabilities.

Hardware is readily available, and cheap - the total cost should
be less than many comparible controllers.

Customer service is excellent, because I know the manufacturer
well (that's me :-).

Disadvantages:
No voice ID or messages, just CW. (But I consider this a
feature, not a bug.) [Note: if voice ID is really required, it
wouldn't be that hard to add.]

Since I don't really plan on making a whole lot of money, and because I
don't think I could even if I tried, and because I basically agree with
Dr. Richard Stallman of MIT that software should be free, and because
releasing this software will be good for the amateur radio community as
a whole:

---> I plan to release the software and hardware design
into the public domain, if there is significant interest.

In the rare case that original ideas Kenneth J. Hendrickson N8DGN
are found here, I am responsible. 1709 S. Bonnie Brae, LA, CA 90006

487. VHF Sweepstakes

Newsgroup: rec.ham-radio
Date: 1990-01-23 12:39:28 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9001240803.AA01287@ucbvax.Berkeley.EDU>
Source record: 13992

An earlier poster asked about the VHF Sweepstakes
this past weekend. Overall, conditions stank.
6 meters was worse than I have heard it in years, with
very little scatter on Sunday morning. Tropo condx
on the higher bands were poor. The ice/snow in the Atlantic
states didn't help activity. I was a tourist only and ended
with about 11K.

The only saving grace was the pathetic aurora on Sunday
night. From 0000 UTC until the end of the contest,
weak Au was present, mainly on 2 meters.

Anyone know any rough scores?

> FM stations the signals are receivable with a decent antenna for distances
> of up to 100-150 or more miles away from the station.

Don't get your hopes up for 100-150 mile range in the Northeastern part of the US. The FCC has reduced required separation is this part of the country, and many of the stations were allocated "before the freeze" with even closer distances. Even then they have been allowed to go to full Area 2 power of 50 kW at 150 m above average terrain.

Thus 99.5 MHz has full-power stations in Washington, DC, Wilmington, DE and New York City, for example. Distances are about 100 miles ON THE SAME CHANNEL. The first-adjacent problem + or - 200 kHz is fully as bad, with stations in Baltimore and SW Washington, DC area spaced by 200 kHz and about 50 miles. The just-being-added Docket 80-90 stations ensure that no station can be relied upon to cover beyond its primary area (~30 miles for Class B, ~15 miles for class A)

Does anyone have any thoughts on indoor verticals? I have considered running a wire up the staircase from the basement; it would give about ten meters of vertical wire. Would a random-wire tuner match such a beast? Would it work for frequencies at which the antenna was greater than 5/8 wave?

Source record: 13996

There's practically no activity on the 30-50 mHz band, since law enforcement has moved to the higher bands. I believe that, since Hams have been deprived of space on 220, we could be given the space between 29.5 and 45 mHz without creating any problems. The new space could be designated the 8-meter band, and could be used for all sorts of data transmission experiments and open to all license classes.

FOR IMMEDIATE RELEASE

ICOM ANNOUNCES THE IC-R1 MINI-HANDHELD COMMUNICATIONS RECEIVER

JANUARY 19, 1990

The smallest wideband handheld receiver available today, the ICOM IC-R1 continuously covers 100kHz-1300MHz with AM, FM and Wide-FM modes. Measuring just 1.9"w x 4.0"H x 1.4"D this tiny receiver can go anywhere with you. The size is unbelievable!

Built-in NiCd Batteries. Like the famous "S" series hand-helds the IC-R1 has built-in NiCd batteries and optional battery packs.

Multi-Function Scanning . The IC-R1 incorporates a variety of scan functions to meet all your needs. They include: programmed scan, memory scan, selected mode memory scan, and auto memory write scan.

Keyboard and Tuning . This compact, easy to operate receiver features both direct keyboard entry and rotary tuning control.

100 Memory Channels . The tiny IC-R1 has 100 memory channels that store frequency, mode and skip functions. You can even mask memories!

Built-in Clock . More advanced functions of the IC-R1 in-clude a 24 hour clock and automatic timer. Your receiver can turn itself on or off. Super convenient for scheduled listening!

The world's smallest full-featured receiver, the IC-R1 is also equipped with a power saver function, adjustabe LCD contrast, a signal indicator, an external DC power jack with battery charge capability plus a large variety of other options from the "S" series handhelds. The new IC-R1 will be available in March, 1990.

FOR IMMEDIATE RELEASE

ICOM INTRODUCES THE NEW IC-R100 ADVANCED WIDEBAND COMMUNICATIONS RECEIVER

JANUARY 19, 1990

ICOM, the champion in receiver technology, introduces the new IC-R100 wideband communications receiver. The IC-R100 provides

tremendous listening versatility in a variety of locations including air band, marine band, and emergency service frequencies, as well as amateur bands. The compact IC-R100 is designed for flexible installation at home or in your car. Go the distance with ICOM's new IC-R100 wideband communications receiver!

*Super Wideband Receive Capability. The IC-R100 continuously covers a wide frequency range within 100kHz-1856MHz in AM, FM, and wide FM modes at home or in your vehicle .

*Easy-to-Operate Keyboard and Tuning Control. The IC-R100 has complete programming versatility. You can use either the keyboard or tuning control to access frequencies and memory channels.

*121 Memory Channels. A total of 121 memory channels are available on the IC-R100. 100 memory channels store operating frequencies, modes, RF attenuator and preamplifier settings. Twenty scan edge memory channels are used for specifying 10 pairs of frequency ranges required for programmed scan. Plus, the receiver has one independent memory channel used for priority scan.

*Built-in 24 Hour Clock. The IC-R100 includes a 24 hour clock and a variety of timer functions. Even if the receiver's external power supply is disconnected the clock continues to run because of the built-in lithium battery. The different timer functions are convenient for scheduled programs, the receiver just turns itself on and off .

The versatile IC-R100 also includes three separate antenna connectors, a built-in preamplifier and attenuator, plus a complete variety of scan functions. The new IC-R100 will be available in March, 1990.

FOR IMMEDIATE RELEASE

ICOM ANNOUNCES THE NEW IC-970 ALL MODE MULTI-BAND TRANSCEIVER

JANUARY 19, 1990

Project yourself into the 21st century with ICOM's new IC-970 all mode multi-band transceiver. Designed for the serious operator on 144, 440 and 1200MHz the IC-970 provides the most futuristic technology for DX, digital and satellite communications.

* Verstile Communications . The IC-970 comes fully equipped as an all mode dual bander for 144MHz and 440MHz. Operate the 1200MHz band by installing the optional UX-97 band unit or listen to what's happening in the world with the UX-R96 wide band receiver unit, receiving 50-905MHz continuously.

* Dual Band Watch . Capable of receiving both main and sub band audio simultaneously. Multiple scanning systems also function concurrently on the main and sub bands.

* Reach Beyond the Stars . Reach beyond the stars with the new IC-970. Communications via satellite has never been so easy. This amazing transceiver automatically tracks uplink and downlink frequencies when the tuning control is rotated. Ten memory channels specially designed for quick satellite communications emphasize ICOM's total commitment to your future communication needs.

* Progressive Quality Throughout . ICOM's extra large multi-function display is easy-to-read, providing complete main and sub band information. 99 memory channels per band store operating frequencies, modes and repeater information.

ICOM's exclusive DDS system accelerates the PLL circuits lockup times and provides improved Carrier-to-Noise-Ratios. A built-in pager and code squelch function, plus direct keyboard entry and ICOM's CI-V system are just a few additional IC-970 features that will propel you into the 21st century. You'll see why the IC-970 is the transceiver of a new generation! The IC-970 will be available April, 1990.

As you may know, the Ariane V35 mission was a complete success. It lofted the new French Earth Resources satellite (SPOT-2) into a polar orbit. It was accompanied by six amateur radio satellites, four Microsats, two UOSATS. Are are performing nominally in orbit. The UOSAT commanders are able to work with the UOSATs with no problem and Harold Price, NK6K, and myself are able to command the Microsats at will. Thanks to the folks at Ariane for another perfect ride.

Bob

Forty years ago, when I was a mere slip of a lad, I had a 40 meter folded dipole made by Amphenol. Same length as conventional dipoles. Are we maybe talking about different things? Mine was a half-wave of 300 ohm ribbon line with the two parallel conductors tied together electrically at the ends and fed with more 300 ohm ribbon connected in a break in the center of one conductor. It was a rather popular antenna then, when TV was new and 300 ohm ribbon was lying around by the ton.

498. Getting on freq.

Newsgroup: rec.ham-radio
Date: 1990-01-23 19:39:04 UTC
From: aaker@Apple.COM
Message-ID: <38048@apple.Apple.COM>
Source record: 14003

A novice asked how to make sure he was on the right freq. to
answer someone. Does anyone have any corrections or additions
to my best advice?

1. Make sure the RIT is OFF, or the RIT control is centered so that you're
listening on the same frequency as you transmit.

2. Tune in the other station so they sound right to you, with correct pitch to
get through the filter of your radio if you have a narrower CW filter.

3. Now leave the tuning knob alone!!! Go ahead and call the other station.
The other operator will adjust their frequency so that you sound right to them
(just like you did).

4. If on their next transmission, they sound like they have moved away from the
correct pitch, use your RIT control to tune them back to the correct pitch.
Don't use your tuning knob or your transmit frequency will move, and then the
other operator will move again trying to follow you. The two of you will
alternately "leap-frog" your way across the band.

5. Misc. & Hints: It might help to know that in trying to put your signal
right on someone's listening spot, you need to turn the knob the OPPOSITE way.
Example: if to you they sound pitched too low, you probably sound pitched too
high to them. To bring yourself closer to the middle, you need to turn the knob
to tune them even lower, NOT HIGHER. Also, make these adjustments very small,
say only half as much correction as you would like to have.

With all this talk about minature receivers, it occurs to me that hams will have a great opportunity for publicity this year. The big movie that will surpass "Batman" in hype this year will be "Dick Tracy" starring Warren Beatty.

Let's have a contest for the first two-way wrist ham radio! Single channel 2 meter FM might work.

First prize - A distinguished listing in the Crime Stoppers Notebook!

Bingo. A "folded diple" is one which is a half-wave long and where the
ends fold back on themselves and join in the center, thusly:

```
_____________________________________________
(___________________ _____________________)
| |
| |
| |
```

Characteristic impedence: 300 Ohms. Most often seen as the
"driven" element of old TV Yagis.

What C. E. Piggot is probably describing is a "bent" dipole,
which is simply a normal half-wave with the ends running
around a corner. It'll have to be a little longer to get
the proper 50 Ohms impedence, but it'll work just fine.
(I worked 35 states as a Novice with 3 Watts on 40 and
15 CW using a bent dipole on the apartment roof. Only
took me 3 months.)

Does anyone have any sources on flat panel's, what I'd like to know
is the disadvantages (size, cost, etc), how they are constructed,
(mesh wire, etc) and how they are steered. I'm looking to build
my own dish (around 4' or less) for the GEOs satellites and since
I'm starting from scratch and am broke I'd like to make this as
cheap as possible and yet work. I just picked up the Satellite Experimenters
Handbook and it has a lot of neat stuff, although it's dated 1985
and I feel that a LOT has gone on since then.

thanks
bob

> good earth grounds to hook up to radio equipment.
>
> 1. What kind of rods to drive into the earth?

You want copper plated steel ones. You can get little ones at Radio Shack,
heavy duty ones at a Ham Radio shop or electrical supply dealer.

> 2. How many?

One is probably enough in relativly most soil. With dry soil you might
want more or longer ones, but a lot of the "lots of grounds" stuff you
read is more appropriate to transmitting. If you do use multiples, they
should be at least as far apart as they are long.

> 3. How deep?

Deeper is better since the effect may depend on getting into contact with
various layers of soil that stay moist>.

> 4. Is there any way to test how good a ground you have made?

Try it. You may be able to get some indication by measuring the resistance
between two, but there is no guarantee that this is constant.

The other thing is to make sure you get a solid contact with the rod so
that it isn't flakey or noisey. Make sure the wire is clamped or soldered
to the rod, the little clamps that come with the radio shack rods are close
to useless. If you use a clamp, you may want to tape or otherwise weather
proof the clamp.

Keep the wire a short as possible and use decent sized wire - about the size
of your antenna wire. A short ground lead works best overall, a longer
one becomes a part of your antenna system and makes the antenna harder to
characterize, especially at higher frequencies.

Will it help? Probably at least some. If you are using an external
antenna, it also give you a place to hook a static-discharge/"lightening
arreastor" to, which may save your radio or prevent shock/fires...

I am thinking about building a peak reading voltmeter into my MFJ dry dummy load, to have another way of measuring power output. I think a half wave, diode-cap circuit should do it, then:
P = (.707Epeak)^2/R
The output of this will be measured by a DVM with input Z > 10 Meg.
I will also require that this circuit not upset the SWR of the dummy load, and be accurate from 1.8 to 30 MHz. (A VHF version will follow.)

So, I figure I need to find a diode with:
1) PRV greater than 200 V, or better.
2) Foward drop as small as possible.
3) Junction capacitance _very_ small.

Any ideas?

507. Logging with KA9Q TCP/IP ?

With the previous (pre-NOS) version of TCP, is there a way to log the results of a Trace to a file ? I'm running in under Unix. I've looked through the documentation and I can only get ftp and misc requests to log, not the trace. Any ideas ? I would like to leave trace on over a period in time and have it all captured.

I know this is for HAm but...

I've got a TRC-430 CB and mag-mount antenna, what would anyone pay for
it if they so desired?

It was used for about ten-days in November, then I left the company with
the company car remaining theirs.

Any askers... paid $136 or something like that (for all pieces).

If you can strip the switch out of the radio entirely, and you have access
to an ultrasonic cleaning bath, then it is worth giving your switch a few
hours being bombarded with ultrasound. Same applies to tuning capacitors.
Use water with a touch of domestic detergent added - this will shift the
grease, dust and years of caked on filth. Wash well after this cleaning to
remove detergent traces (and any adhering crud),
dry in an oven { but dont melt it :-) } re-lubricate and re-install.
This method cured a 'jumpy' local oscillator in my AR88, but
be prepared for a battle of wits in just getting the switch out of the radio -
in some instances the radio looks to be assembled around the switch with
no thoughts of how to ever get it out! You may be able to pull the switch
spindle out the front, then remove individual wafers one at a time.
Ultrasound is quite wonderful for cleaning things up - tube sockets, variable
capacitors, front-panel knobs etc. all shine like new after a few hours in
the bath.
Dont try this technique with meters or dial-plates though - there is a
tendency for the printed calibrations to come off!

For your info.: KYOI was sold to the Christian Science Monitor in 1987 or 1988. It went off the air during the summer of 1989, and came back on the air in the fall of 1989 with the new callsign KHBI. During the summer of 1989 the station's transmitter and anttenna facilities were upgraded (in particular a 2nd 100 kW transmitter was added). This station now broadcasts the World Service of the Christian Science Monitor (as well as Christian Science religious programs) just like WCSN (Maine) and WSHB (So. Carolina).

It's legal to use an antenna capable of handling 2 kw PEP with your 12 watt PEP legal CB rig, as far as I know.

I'm not against selling CB equipment. I'm against selling CB equipment that has been modified, or can be easily modified, to operate outside of the CB bands.

Subject: ARRL ham insurance
Message-ID: <1990Jan23.201521.5140@deimos.cis.ksu.edu>

Several expressed interest:
>I'd like to hear comments from anyone who's had experience with ARRL
>claim payments -- were you happy?

Because of lightning strikes to/near its repeater, my local repeater
group has had to file claims of about $800 twice in the last three
years or so. Both were paid promptly.

One of the strikes even zapped my almost-brand-new wide-area digipeater
housed in the same building as the audio repeater. Even though some
of my equipment hadn't yet been insured (the rules say something to
the effect that newly-purchased equipment up to some maximum value is
automatically insured until the next premium is due), my claim was paid
promptly.

>Also, my impression is that their rate is very competitive -- much
>better than I could get on a rider; has anyone found the opposite?

I would be happier if they were lower :-), but I am satisfied with
their rates compared to any others I've ever seen.

>----------

Current commercial practice is to insert the modulation at a low level
(milliwatt range) just after the rf exciter. A diode ring modulator is
generally used followed by a SAW filter for vestigal sideband filtering
and carrier is reinserted after the SAW filter. Remember that TV transmits
the full upper sideband+carrier and the first .2Mhz of the lower sideband.
This technique allows bandwidth conservation while allowing simple
envelope detectors to reliably recover sync.

High level modulators suffer from incidental phase modulation which is
very difficult to tame and the need for large water cooled filterplexers
to remove the lower sideband. Also it is much more difficult to get
good linearity and chroma to luminance delay characteristics with a
high level modulator. A box called a predistorter is needed. A predistorter
shapes the video waveform to compensate for the transfer characteristics
of the high level modulator and modulated rf stage. These boxes are both
difficult to build and tempermental to adjust.

If a cruddy mono bandwidth hog is your goal, use high level modulation
without a filterplexer as is done in certain commercially made equipment
sold for amateur tv. On the other hand, if you want high quality color
transmission using socially exceptable bandwidth, use low level modulation
with good filtering and a good linear amp.

With all this talk about minature receivers, it occurs to me that hams
will have a great opportunity for publicity this year. The big movie
that will surpass "Batman" in hype this year will be "Dick Tracy"
starring Warren Beatty.

Let's have a contest for the first two-way wrist ham radio! Single
channel 2 meter FM might work.

First prize - A distinguished listing in the Crime Stoppers Notebook!

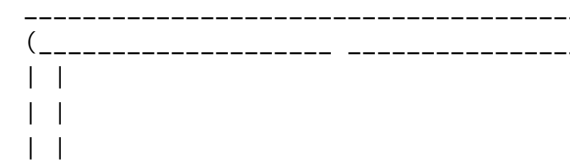
Bingo. A "folded diple" is one which is a half-wave long and where the
ends fold back on themselves and join in the center, thusly:



Characteristic impedence: 300 Ohms. Most often seen as the
"driven" element of old TV Yagis.

What C. E. Piggot is probably describing is a "bent" dipole,
which is simply a normal half-wave with the ends running
around a corner. It'll have to be a little longer to get
the proper 50 Ohms impedence, but it'll work just fine.
(I worked 35 states as a Novice with 3 Watts on 40 and
15 CW using a bent dipole on the apartment roof. Only
took me 3 months.)

In your price range, the S-Comm 7K controller is an excellent choice.
It will give you lots of programming capability, optional voice synthesis,
and outstanding construction quality and durability (they also make
variations for commercial applications). Contact Bob, WA9FBO at S-Comm
at (303) 663-6000.

Numerous repeaters along the Colorado Front Range have been upgraded to
this controller, and users are very happy with it.

Has anyone tried using the TI 99-4/A computer in a packet application? I still have one that is collecting dust, and have recently obtained a Ham license. It occurred to me that I might be able to ressurrect the ol' -4/A for packet use, but I don't know how (if) the 40-column display would work; or what other equipment would be needed (besides a TNC, of course). The system I have consists of the main keyboard unit; P-Box with mem expansion, IEEE-488 card and disk drive controller; and a TE-1 emulator cartridge.

I also am trying to learn about packet, so please keep this in mind if you respond. I'm not yet familiar with many of the packet terms. Any info- from 99/4A packet users would be appreciated.

Thanks,
Dube Todd, N5PDK

Sounds great to me. I would just add one more step. When I first started out I didn't know the value of the CW filter. (I purchased one 3-days into enjoying CW :-))

> 2. Tune in the other station so they sound right to you, with correct pitch to
> get through the filter of your radio if you have a narrower CW filter.

If you don't have a narrow filter, tune the station until it zero-beats: you hear a puffing tone (or less). Then, turn down-band exactly 800Hz. You should be at the familiar CW tone, and also withing that stations filter.

>restrict most of us in the higher latitudes, or will it be a
>higher orbit, similiar to the last one we worked with
>back in 1985? Also, will there be any SSTV on this
>flight or just packet?

Current information is that the next SAREX flight, STS-35, with Ron Parise, WA4SIR, will have a 28-degree orbit; the one after that, STS-37, with Ken Cameron, KB5AWO, is supposed to have a 39-degree orbit, which will do better for those in the higher latitudes.

STS-35 will not have SSTV aboard due to stowage space constraints - they had to squeeze to keep packet in the plans. Present plans for STS-37 include SSTV.

STS-35 is now scheduled to launch in the late April/early May timeframe, and STS-37 in the June/July period. There is a possibility that STS-37 may be postponed to next January, though.

Subject: RF Voltmeters

Don't use a resistor string to drop the voltage to the diode. The capacitance of the diode in such a dividor makes the voltage division frequency sensitive. You will get significant variance in readings between 80 and 10m with that approach. Also be careful of the resistor that is normally found in the DC probe for most VTVMs. If you build a special cable, the DC voltage division the VTVM expects will be off and give significant errors. Be wary of the various published circuits for such RF probes. I have not seen one where the DC voltage dividor circuits were calculated correctly (not just due to standard resistor values which is another problem).

You'd better tell the California Highway Patrol first. They still
operate almost smack in the middle of the range you mentioned (about
42 MHz). And there are the 46 MHz and 49 MHz appliances.

Is 6m that conjested in the '5' region that you need a new low-VHF
band? The only activity I hear on 6m around here seems to be JA's
in early afternoons :-) :-).

523. VHF Communications Magazine

Newsgroup: rec.ham-radio
Date: 1990-01-24 16:54:34 UTC
From: rkarlqu@hpscdc.scd.hp.com
Message-ID: <5490087@hpscdc.scd.hp.com>
Source record: 13878

Many people have sent email asking about how to get "VHF Communications" magazine, so I thought it would be of general enough interest to post. For those not familiar with the magazine, it is published in Europe and the articles in the European edition are in German. However, an English edition is avaiable over here.

The content is similar to what Ham Radio Magazine used to have under the editorship of Jim Fisk, before it was reformatted last year to downgrade the level of the technical articles. The authors in VHF Communications are hard core homebrewers doing state of the art work. If you're a Novice or want one evening projects, stick with Ham Radio, but if you want heavy duty technical articles, you should consider switching to VHF Communications. By the way, the magazine is not really exclusively about VHF topics as the name would imply. There has been some good stuff about DSP recently.

To subscribe, send $20.95 for one year (4 issues) to:

Timekit
PO Box 22277
Cleveland, Ohio 44122
(216)-464-3820

Add $5.00 for airmail. Back issues are available also.

Timekit also sells parts, PC boards, and kits to support the construction projects in the magazine.

Rick N6RK

(I have no conection with Timekit or VHF Communications; I am a disinterested party---disinterested in Ham Radio Magazine that is :-)

524. 6M AM Activity in SNH and EMA

Message-ID: <9001241708.AA05338@decwrl.dec.com>
Source record: 13879

6 Meter AM is alive and well in Southern N.H. and Eastern Ma.!!! There are 15-20 regularly active stations.

There is a daily (Monday - Sunday) net on 50.250 MHz from about 6:00AM to 7:30PM EST.

The "Boat Anchor Net" is active most nights at 9:00PM EST on 50.250 MHz.

On Saturday and Sunday mornings around 8:00 AM (+/-) there is activity on 50.400 MHz.

These are all VERY informal chat nets. All checkins are welcome. Dig out those old 6 meter AM rigs and join into the fun!

Scott

>want more or longer ones,

As Mike Smith told me via email, to help get a better ground in dry soil
you can water the rod once in a while or put fertilizer by the rod (it
ionizes the soil).

>The other thing is to make sure you get a solid contact with the rod so
>that it isn't flakey or noisey. Make sure the wire is clamped or soldered
>to the rod, the little clamps that come with the radio shack rods are close
>to useless. If you use a clamp, you may want to tape or otherwise weather
>proof the clamp.

Watch this one - building codes here don't allow you to solder your
ground wire to your ground rod - you have to use a clamp (maybe they
want you to be able to unhook it quickly if you strike a cable when
driving in the rod - I dunno). The store I got my ground rod at had
hefty brass clamps right next to the rods, so this was no problem.

Why does the clamp need to be weatherproofed, George (or anyone)?

>Keep the wire a short as possible and use decent sized wire - about the size
>of your antenna wire. A short ground lead works best overall, a longer
>one becomes a part of your antenna system and makes the antenna harder to
>characterize, especially at higher frequencies.

Mike also told me to keep the ground wire as short and fat as possible.
My office mate helped quantify that - he said that anytime the ground
"wire" (mine is 4 guage - more like a cable than a wire) is more than
about 1/4 wavelength it starts looking like impedence to the receiver
and you start to get some losses. I was able to keep mine down to
about 11', which might barely allow the 13m band without loss but,
by the above formula, causes a bit of loss for the 11m band.

I'd advise against soldering the wire to the ground rod too, but for a different reason. I have seen many examples of soldered copper wire connections CORRODING. This probem is particularily bad if there is salt in the air like on the Gulf coast.

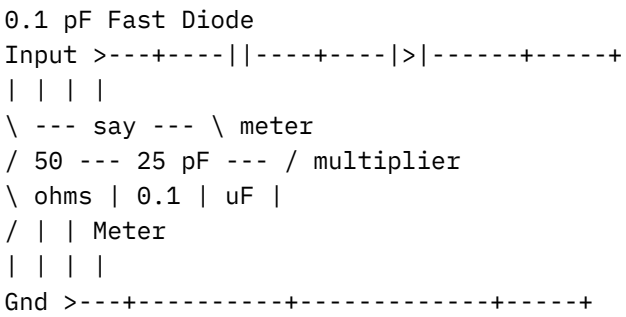
All the dummy load - power meters I have seen use a capacitor voltage divider before the voltmeter. This brings the voltage down to a reasonable value for very high speed diodes, and mostly eliminates the VSWR problem.



In this circuit there would be a 250:1 voltage division before the diode, enough for HIGH power. You probably want a hot carrier diode and about 3 volts pp at it. The 25 pF should be large compared with the diode capacitance. The 0.1 pF should be a fairly high reactance compared with the 50 ohm dummy load, at the highest frequency of interest. The lowest frequency where this will work well is where the input impedance of the diode detector is no longer large compared with the reactance of the "25 pF" capacitor.

Source record: 13884

You may not hear much in this range, but a number of people are interested in it. Something like each alternate 1 MHz section is "Government". I've seen earnest proposals to gather up even more for Govt Meteor-Burst links. This is, in fact, the optimum frequency range for meteor-burst - a mode which finally looks to be taking off. Its "somedays" DX propagation makes it less attractive than the higher bands for most fire/police/taxi/etc purposes, but there seems to be enough other use so that the is no hope of getting more for hams use. The real worry is keeping the present 50-54 MHz ham band. If we don't watch out we may find that we hams are just a (rather useless) guard band between channel 2 and other people who have taken the lower part of six. An example of one of the many people who want this band is the AM Broadcaster in New Jersey who wants to see an "FM2" broadcast band - so that the AM-only stations will be able to have FM outlets, even though the present 88-108 band is full. He has variously asked for the 50 and 220 MHz ham bands. While he will (most likely) not succeed, others will keep trying.

Six-meter ham activity is a very "bursty" thing. When there is DX, the bottom hundreds of kHz of six fill up, the rest of the time there isn't much going on. While six has been my favorite band for many decades, it's hard to make a case for more ham frequencies in this region, and could be hard to defend all we presently have. I would suggest that we should put some emphasis of ham meteor-burst activity on six - maybe I'll eventually get time to put my effort where my mouth is.

The A.C.C. RC-85 is about $900 and includes phone patch with a 200-slot dialer memory, limited-vocabulary voice msgs, and support for ICOM 900-series band modules (with extra-cost adapter, of course). I wrote a program to configure this controller using a PC and Hayes-style modem. The stock linking capabilities of the RC85 are not too great (IMHO).

The S-Comm 5K controller also has some possibilities; I believe 73 or Ham Radio Mag had an article about constructing a link interface.

>73 Gary KE4ZV
>WXIA-TV Atlanta

I second Gary's comments. I spent my college summers engineering at WMPB-TV, the Baltimore PBS station. They have a high UHF (channel 67) klystron-based transmitter. Klystrons are inherently highly nonlinear devices, and I became well acquainted with the techniques used to deal with them. One had to really stretch the sync pulses in order to drive the klystrons to full output, especially as the tubes aged. It took a lot of work to get the differential phase and gain ("intermodulation distortion" in audio terms) down to par. One quickly appreciated the wisdom of choosing negative video modulation as the American TV standard (with negative modulation, white -> less power, black -> more power, sync -> max power).

BTW, the standard test signal for adjusting linearity is called a "modulated stairstep". It resembles a grey scale, except it's a sickly looking greenish-yellow color (the hue corresponding to the NTSC reference color burst phase). If you see this signal on a TV station during test time, you can be pretty sure they're trying to adjust out the effects of their transmitter's nonlinearities.

The filterplexer in our case wasn't water cooled (peak visual transmitter output power was only 50 kw) but it was still a very hefty piece of hardware on the ceiling, with impressive heatsink fins.

Considering that VSB filtering is mandatory in any socially-acceptable video transmitter, low level modulation followed by linear amplification is clearly the way to go in an amateur TV transmitter.

Sure, it would be nice, but in my area, there are several control channels for paging transmitters on that band, and there are several paging transmitters too! Also, the CHP uses the 42 mHz -> 43 mHz region for all of their communication, and are not planning on changing to any other band. Also remember there are cordless telephones in the 46 -> 49 region, and I think there is even a CB band in there somewhere.

So, you always wanted to get into satellites, but couldn't affort the bucks for the multimode rigs and az-el antenna rack?

Well folks, "the times, the are a changin'"! With a $100 2m FM rig, a $50 TNC, and the terminal / computer of your choice, you can copy the telemetry and bulletins from the DOVE Microsat. Really! Just take your packet station, and put it on 145.825 MHz. If you want to get fancy, you can run an orbital prediction program, and wait for 5-7 minutes of packets from DOVE. But, if you have a way of saving packets, just leave the radio on for a day (24 hours). Either way, amateur satellite hacking has never been easier!

I copied about seven minutes of telemetry tonight (1/24), in the San Francisco Bay Area. [Yeah Bob, the MM is still off quite a bit.] Give it a try!

> 73,
> Dube Todd N5PDK

HOOO Boy! Where do I BEGIN with this one?

"Practically no activity on the 30-50 MHz band" ?? I don't get it...Dube lives in Texas, and here we are at the PEAK of Cycle 22, and he can't hear all the activity, especially in a southern latitude??!?!?

To start of with, there are the cordless phones and baby monitors from 46-49 MHz. In the middle of that range are a bunch of freqs used by the Red Cross, and here in the state of Washington there are frequencies used by the state highway department. Also a lot of search and rescue activity here.

But Dube mentioned 29.5 to 45 MHz....well, we already have 29.5-29.7, but above that are some federal govt and military freqs. Just above 30 MHz are local govt (police, fire, govt administration and even the California Highway Patrol!) freqs about every 20 KHz covering the whole spectrum.

With the peak of the sunspot activity now upon us, there is lots of skip coming in from all over on this spectrum. Local municipalities and state services experience a lot QRM from central and south america.

I am afraid that this wont work. Also, this part of the spectrum is not allocated for amateur use internationally. The reason they were able to take away part of 220 MHz is that it was not allocated to amateur use exclusively.

544. problems with solid state rotor control

Newsgroup: rec.ham-radio
Date: 1990-01-25 09:44:07 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19347@bellcore.bellcore.com>
Source record: 13899

A couple of years ago, I modified my Kenpro KR-400 and KR-500 az and el rotor control boxes for external computer control. I did this by building what amounted to four solid state relays out of Radio Shack triacs and optoisolators and installing two in each box. TTL levels through a DIN connector actuate one of the two relays depending on the desired direction.

The other night, during a Microsat pass, I noticed that the az control box was humming rather loudly, and it was quite warm to the touch. Further investigation revealed that the rotor turned quite slowly in the right direction when the manual button was pushed, but normally in the left direction when the other button was pushed.

At first I thought the switch was defective; it felt a little funny, and I could hear the sounds of arcing inside. But it turned out that one of my little solid state relays was in fact to blame, the one connected across the "left" switch. It seems that the triac had begun to trigger itself erratically when not commanded to do so, and this was "fighting" the manual "right" switch.

I can't remember the voltage rating of the triacs I originally used, but I theorize that inductive spikes from the rotors eventually fried the triac. I replaced the defective one with a new triac rated for 400 PIV, and I also installed 120V MOVs across the terminals for each rotor winding. This should limit the inductive spikes to something the triacs can handle.

Just thought I'd mention this in case anyone else has made a similar modification to their control units. Even if yours hasn't failed it wouldn't be a bad idea to add the MOVs. They'll give you a small measure of protection against nearby lightning spikes as well.

545. Mixer linearity..

Newsgroup: rec.ham-radio
Date: 1990-01-25 10:28:04 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <25.Jan.90.10
Source record: 13900

Brian Daly raises some very valid points: At VHF/UHF/Microwave, the need
for pre-mixer RF amplification is there i agree, however, for practical HF
receivers in a terrestrial environment, i still feel that there is far too
much attention paid to getting gain! Remember, the gain you should use
depends on where in the signal path it occurs. I still stick to my thesis that
the fewer non-linear (or potentially non-linear) components of the signal
path, before the filter has taken out all the 'nasties', the better.
Some people have even considered the possible non-linearity
of the B-H (hysteresis) curve of ferrite materials to be a potential problem,
also there is a risk that if crystal/ceramic filters are driven too hard, then
they may be driven outside the Hooke's Law region of the quartz/ceramic,
and introduce 'mechanical crossmodulation'!
(you certainly can generate wonderful splatter if you saturate a ferrite
antenna balun, so theres SOME credence to the idea that the same problem
could occur in receivers..)
Balanced FET mixers (particularly if they use FETs that can handle reasonable
power, and run with plenty of standing current) do make a fine mixer I
agree. But in my experience they give up far sooner at high signal levels than
does a doubly-balanced diode quad. When you are operating from a site
which is less than 500 yards from a 500Kw FM broadcast transmitter, you need
all the overload capability you can get - my hotcarrier-diode-ring
and the 7360 seemed the only things that could handle the heat.

546. Voice Mail Box For Repeaters ?

Newsgroup: rec.ham-radio
Date: 1990-01-25 12:45:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <90012509943@RELAY.CS.NET>
Source record: 13901

I'd like to construct a voice mail box for our local repeater. There are some devices on the market (ACC, Micro Control, etc.) that can do this very well by using DRAM IC's. Problem is that they're not very efficient and one has always got to worry about 'the clock running'. The Advanced Control DVM costs as much as a PC and can only hold 10 minutes worth of voice.

There is a device made to interface a PC with the phone line which stores voice to the hard disk. True, this may bit a bit slower but still, not appreciably. This device is called "The Complete Answering Machine". I understand it works well (menu driven) with the phone - has anyone attempted to interface this device to the controller of a repeater ??? What controller was used and was it successful ?

The "Complete Answering Machine" is a device used in many menu driven "900" numbers. The A/D sampling rate is high enough that one can not differenciate between a taped message and the digitized message.

> states didn't help activity. I was a tourist only and ended
> with about 11K.

I have to agree with Mike. I have operated a number of January VHF events from a variety of locations on the East Coast and cannot remember conditions and activity being so poor. Undoubtedly the weather (at least in the Northeast) was a big factor. I operated from K1TR's home station in southern New Hampshire and had a great time, despite the poor conditions. Perseverance pays off in a contest where conditions are so poor!

Many participants complained of iced-up antennas and antennas whose patterns were extremely skewed. One example was KF6AJ/1 in Danbury, CT. Normally an easy QSO, he had mediocre signals on 50-220 MHz and a horrible signal, despite running a decent deal of power, on 432 MHz. His 432 MHz antenna was actually working backwards! Normally 432 MHz has 1-1.5x the number of QSOs made on 220 MHz but not this time.

I was running 100W on 50 MHz so I couldn't make a whole lot of noise on scatter but I worked a couple of the bigger stations out at optimal scatter range on Sunday morning. WB2OTK in South Carolina was REAL LOUD on scatter with an excellent residual signal and N9JF in EM49 (real nice signal and a good scatter op).

>
> The only saving grace was the pathetic aurora on Sunday
> night. From 0000 UTC until the end of the contest,
> weak Au was present, mainly on 2 meters.

I didn't realize there was aurora until the last hour of the contest but I agree that it was pathetic. The only stations heard in southern NH on 50 and 144 MHz were from western NY and southern Ontario (also nothern NY). I worked W9IP on 50 MHz and we moved rapidly to 144 and 220 MHz but no luck on 432 MHz. Thanks Mike for FN24!

> Anyone know any rough scores?

My final score (used K1EA ConTest logging program, a pleasure as usual) was:

Band QSO QSO Points Grids
50 125 125 24

144 298 298 29
220 91 182 19
432 91 182 18
1296 7 28 2

---
612 815 92 ------> 74,980 points

Any other scores or rumors out there?

I have a toy AM transciever xtaled on 50.585Mhz. I saw "toy" because it's only a regenerative reciever, and something like 10mW transmitter. Like one of those radioshack Space Patrol toys. The reciever isn't that selective, like 1Mhz bandwidth! Why did I bother to put it on 6M, from 49Mhz? Had nothing better to do one afternoon, and had the above xtal in the junk box. I brought it along when I visited a ham friend, who has 6M radio. He had it crossconnected to a 2M rig, to act like a crossband repeater. So, I actually had a QSO using my toy! I don't expect to have many more, unless someone with an AM 6M rig lives within 500 feet of me :-)

552. J-pole verticals

Newsgroup: rec.ham-radio
Date: 1990-01-25 16:35:19 UTC
From: avip@iilcad.intel.COM
Message-ID: <9001251635.AA20204@iilcad>
Source record: 13906

Thanks for the responses I got on my 1/2 wave verticals query. I'm trying to get a better understanding of the principles of operation of the J pole antenna.

Can a J-Pole antenna be seen as a 1/4 wave vertical with a 1/4 wave shorted stub impedance adaptor at the bottom end?

One of the stub legs is connected to the upper 1/4 wave length of the antenna, the other is kept open. Between a 1/4 wave vertical element and GROUND there is an impedance of 36 ohm, theory says.

```
|
|
|
| Z between A and ground is 36 ohm
A B Z between A and B = ???
| |
| |
| |
|\|\______
+-\_______ feedline (50 ohm)
```

Question: What is the equivalent impedance at the input of the stub (i.e. between A and B)? If I know this, and given the stub's Zo, I can find the 50 ohm point for the coax connection using a Smith chart. This would help in the adjustment, by having a good starting point to connect the coax straps.

(This "open circuit" connection to the end of a transmission line confuses me. I have seen similar connections in old editions of the "Handbook" showing end-fed dipoles. Can somebody explain me how does the stuff work?)

This kind of reminds me of the "monster cable", or something like that,
which is being advertised to "audiophiles" as being better for your stereo
system - less distortion, more power to your speakers, "you can hear the
difference". You know, the cables with like 1/4" copper conductors rated
at 10000 Amps or something ungodly. The word "overkill" becomes an
understatement...

Makes me laugh every time I see one of those ads. I actually have seen
people spend the $1 per foot for this stuff.

I guess the problem is where you are listening/reading if you don't hear about six. There certainly some mention on this net. The "World Above 50 MHz" in QST has received complaints about too much emphasis on six..... No, it isn't on every rig you can buy, but Icom, Kenwood, etc build HF rigs which also cover six (TS-680, 767, etc, etc). Clearly hundreds of FT726 and 736 rigs have been sold, many with 6-meter modules. And I'm only talking about the CW/SSB end of the band.

Please give me a hint as to where you can find cheap 50 MHz rigs, SMIRK (Six Meter International Radio Klub) is always in the market for loaner and cheap rigs to give/loan to hams in interesting DX locations. FM-only rigs need not apply.

A handful of hams now have applications in for DXCC (100 countries confirmed) on six meters.

Remember to set your clock carefully. On the low earth birds a 20 second error in clock makes a big percentage difference in the AOS/LOS/AZ/EL mean error in a pass.

You should have seen the elements I got from them. Just pure crap. I spent hours working on them, transforming coordinate systems (they don't tell you what coordinate system their elements are referred to). An apogee and perigee that we 30 km different than those derived from the semimajor axis. On and on and on. At my QTH, with the mean motion set to 14.28575 rev's per day, they are still the best element set.

It appears that UOSAT MIGHT be 3 for 3 on their lifetime launches. If you have heard UO-15, please post times/etc. here. The temps were a little warm it seemed to me but Jeff Ward's note seemed to think it was ok. They are almost 15 C warmer than the Microsat's. I hope that UOSAT E, Now UO-15 is not in serious trouble. Send me reports and I will pass via Telemail.

Subject: Half-wave vertical

The J antenna is mostly like a 1/2 wave vertical with a 1/4 wave matching transmission line feeding it. The impediance at the bottom of the 1/2 wave vertical should be infinity (voltage maximum, current minimum). A quarter wave feedline matches the infinite impediance down to 0. By tapping in somewhere above the 0 point, a 50 ohm point is achieved.

In reality, the impediance at the bottom of the 1/2 wave vertical is much lower than infinity. Someone claimed the impediance of my Cushcraft R3 was approx 1500 ohms with some reactance (not specified). I don't have the equipment to measure it, but the sizes of the matching box components indicate that the number is not too many orders of magnitude off. The length of the matching line is usually adjusted to compensate for this through trial and error. There are some emperically derived lengths for the matching line that seem to do the trick nicely. I don't have the numbers handy, but they could be found if desired.

>no new equipment for it and the used 6m rigs go for a song.

Well, I can try to answer some of your questions, I'm sure W9IP or someone else will fill in the holes.

The 6 meter band is not unpopular, to the contrary for the hams who use it it is very exciting. In the June VHF contest, for example, most stations will have their highest QSO and multiplier totals on this band. 6 Meters bridges the gap between HF and VHF - it has all of the standard VHF propagation modes such as Aurora, Tropo, Scatter, E-skip, Meteor Scatter and Moonbounce (earth-moon-earth), *plus* there are F2 openings that allow you to work over paths between 5 and 10 *thousand* miles!

If you just go by the articles in this newsgroup, you'll come to the conclusion that all hams either

1) tinker with gear,
2) have 440 rigs that are modified to listen out-of-band,
3) are active DXers or contesters, or
4) never get on the air and spend their time complaining about
the rules

True, 6 meters is hardly ever mentioned here. Few people, if any, use it in their cars like the 2 or 440. You wouldn't want to use it for packet, the baud rate is too slow. The antennas are bigger than you average 2 meter FM antenna, but heck, they're smaller than a 20 meter beam! And true, there isn't any really new gear coming out, but the functions that people need on their new whiz-bang-smaller-than-a-credit-card handi talkies just aren't needed or used on 6. 50 MHz attracts both DXers and VHFers, and it's a great band for people who like both.

Source record: 13912

I have recently petitioned the frequency coordination gods here for a 440 pair. Every pair is used in this area, but several pairs are shared by several repeaters. [Almost all the repeaters on 440 here are private, and closed. :-(] Several people have advised me that the frequency coordination gods may not smile upon me.

If the gods are not friendly, I plan to appropriate a frequency for myself anyway. [I am a rebel. :-)] There are no machines on the 12.5 kHz splinter channels here. I have thought about the possibility of putting up my machine on one of these channels, with my output near the input of other repeaters, and my input near the other repeater's outputs. Other than raising the noise floor on the band, I don't think there would be any problems since everything is PL'ed.

Has anybody had any experience with this? Is it better to invert the closely spaced repeater (input close to other repeater's output)? What do the commercial people do? Please post or e-mail your responses, and thank you very much in advance.

562. Need info on rechargable Alkaline battery

Newsgroup: rec.ham-radio
Date: 1990-01-25 21:10:43 UTC
From: jim@mmsac.UUCP
Message-ID: <3738@mmsac.UUCP>
Source record: 13915
Cross-posted to: sci.electronics,rec.ham-radio

I recently aquired an old Motorola VHF Hi lunchbox radio. It
is a one-channel FM receiver/transmitter, and it puts out about 1
watt. It has a rechargable 6-volt, 4 amp-hour battery in it, that is
dried out, and doesn't work. If I supply 6 volts at about 1.5 amps to
the radio externally, it works fine.

Now, the battery has little screw-top covers on each cell, and I can
see the little sheets of metal and what looks like cardboard inside,
but it is completely dry.

Can I make this battery work again? Would it work if I put
hydrochloric acid in the cells (like from a car battery)? It says on
the side of the battery that it is a rechargeable alkaline battery,
and should only be charged with an approved Motorola charger.

Is there some kind of alkaline liquid I could put in it to make it work?

Any info would be helpful.

One suggestion I haven't seen so far is de-imaging the stock quotes given on whatever the "business channel" is (I don't have/watch cable TV (yet))... I've seen this on other's cable-connected veletisions on occasion.

Now, from (dim) memory, I recall an article in 73 Magazine from back before direct ASCII transmission was legal on our bands...someone showed that you could put letters on a SSTV image, transmit it LEGALLY (Uncle Fox said so!) and pick the image apart at the end to get your text. It was an administrative kludge, rendered pointless by authorization to use ASCII, but the idea may be useful here.

The image (as I recall) has a small rectangular portion of the screen display-ing stock quotations in a moving-strip (ticker-tape?) fashion. A frame grabber could "grab" every few seconds, and only a small portion of the image would need to be processed, so it should go quickly, and you generate a nice little tickertape file.

I don't know:
o How much it would cost
o How quickly the processing REALLY could be done
o How "old" the televised quotes are
o If anyone really gives a damn

There's the idea. Now, kick it around a bit.

Have fun,
n5gax

Source record: 13917

In article <9001171628.AA04357@zit.cigy.> jcp@cgch.UUCP (Joseph C. Pistritto) writes:
> Does anyone know what the rules are if you are licensed in
>more than one country? I know that in each country you hold a license
>in, you must use the privleges and callsign assigned by that country,
>but what happens if you go to a third country to operate?
>
> In particular, I hold a Technician license in the US, and the
>equivalent license in Swizterland. The licenses differ, however in
>the assignment of powers and frequency allocations (for instance, Tech
>class in Switzerland has no 50Mhz band privleges, and only 200 watts
>maximum power). What happens if operate in Germany (which is 400
>meters away for me). What happens if I operate MOBILE in Germany, etc?
>
If you hold a CEPT licence (i.e. European licence) you can operate in any
CEPT country under the provisions of CEPT T/R 61-01. There are many rules
though. Some are:
(Lifted from my latest UK licence)

a) You must be a temporary visitor and non-resident.

b) Operate only mobile or portable.

c) Comply with the requirements applicable to the use of W/T
apparatus at the location of operation in the host
country.
d) Comply with thus licence unless such complience would result
in a breach of the requirements of the host country.

e) present this Licence upon request to the relevent supervisory
authorities in the host country.

f) if he possesses an Amateur Radio Licence (B), [A VHF licence]
use only those frequencies above 144 MHz authorised for
use by licenced amateurs in the host country.

g) use his home call sign after the appropriate host country call
sign prefix.

h) comply with the relevant provisions of CEPT Recommendation
T/R 61-01.
> By the way, would contacts made under both callsigns count as
>one person for DXCC purposes?

B. T. W. before I got my U.S. call, I had an FCC permit to operate which
stated:
Operation under the terms and conditions of the license
issued to the alian by his government, but not to exceed the FCC Amateur

Extra class privilages.

Gateway: The ARRL Packet Radio Newsletter - Stan Horzepa, WA1LOU - Editor

Volume 6 - Number 9 - January 19, 1990 - Part 1 of 4

Published by the: American Radio Relay League
225 Main Street, Newington, CT 06111

HAM SATELLITES' LAUNCH DELAYED UNTIL JANUARY 21

On January 8, Arianespace officials announced that the V35 launch of the Amateur Radio Microsat and UoSAT satellites will be delayed further due to problems with the non-Amateur Radio SPOT-2 satellite, which is the primary payload of the mission. The problem with SPOT-2 was due to a magnetic tape recorder failure. The launch is now scheduled for January 21 at 01:35 UTC.

from Bob McGwier, N4HY and Eric Rosenberg, WA6YBT via CompuServe's HamNet

SKIPNET STA EXTENDED

The FCC has granted a one-year extension of the STA (special temporary authority) for automated packet-radio operations on HF for SKIPNET participants. This January 4 action is in direct response to an ARRL request.

ARRL AWARDS FIRST GRANT FOR HF PACKET-RADIO RESEARCH

The ARRL made its first technology grant of more than $1000 to a team of investigators headed by Stephen Hall, WM6P, for research in diversity reception of HF packet-radio signals. Co-investigators in the team are Andy Demartini, KC2FF, Wally Lindstruth, WA6JPR, Bill Lake, WB6RIJ, Herb Duncan, WE7L, and Peter LaCount, W8UXD.

The objectives of this work are to investigate the benefits of diversity reception for HF packet radio, design practical diversity antenna systems, modem characteristics and receiver design for diversity. Funds provided under this grant are for purchase of equipment, electronic parts and other out-of-pocket expenses in connection with this research. The team members donate their volunteer labor and much of their own equipment in carrying out this work.

NEW VERSION OF ARES/DATA AVAILABLE

Version 1.1 of ARES/Data is now available. The new version of this multiconnect, multiport, generic data base program for the IBM PC and compatible computers provides the following three new features.

A STATUS command provides a brief status of the system, ie, the current LABELS and WIDTHS settings and the current data base size.

An automatic Origin Indicator at the beginning of the MESSAGE field indicates which station last updated each record. The station's call sign or the word "SYSOP" will appear here, so in case of data entry errors or other questions, everyone will know who made each entry.

A WIDTHS command allows you to more neatly format output data on the screen. It does not change the data in any way, but provides a way for the column output to "look right." If the value for any field is shorter than the defined WIDTH for that field, when that record is displayed, spaces will be used to keep the fields aligned. If a given value is longer than the specified WIDTH, then all of the value is displayed.

The program may be downloaded from CompuServe's HamNet or may be obtained by sending a blank disk (5-1/4-inch 360-kbyte or 3-1/2- inch 720-kbyte) and return postpaid disk mailer to:

W.E. Moerner, WN6I
1003 Belder Dr
San Jose, CA 95120-3302

ARES/Data may be distributed freely as long as distribution is on a nonprofit basis.

from W. E. Moerner, WN6I @ KB6OWT

PACKET RADIO MANUAL IN BRAILLE

Northern Nevada Braille Transcribers, a volunteer, nonprofit, tax-exempt group, now has the MFJ-1270 TNC 2 Packet Radio Owner's Manual available in braille. It is contained in six volumes of various lengths. It is also available on an Apple computer floppy disk. This braille manuscript is available without charge to anyone who can use it, however, contributions in any amount are gratefully accepted. Interested parties can write for additional information to Northern Nevada Braille Transcribers, 1015 Oxford Ave, Sparks, NV 89431.

from The ARRL Letter

Volume 6 - Number 9 - January 19, 1990 - Part 2 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED

Much grumbling is heard these days about bulletins in the PBBS network. The complaints include such things as there are just too many bulletins for PBBS users to sift through, many of them have inappropriate distribution (items of purely local or regional interest being propagated around the world), you often can't tell what the subject matter is without reading them, important local items are missed in the hodgepodge of bulletins from

afar and so on. To a certain extent, these are problems of user education. PBBS users need to be informed more emphatically not to send "for sale" items to @ALLBBS, to use more informative Subject lines, etc. The real problem, however, is that PBBS SYSOPs lack the bulletin management tools which would allow them to bring some order to this chaos.

Anyone who uses landline BBSs, information utilities such as CompuServe, or computer networks such as USENET, already has an appreciation for one major shortcoming of PBBSs. Unlike those systems, the packet-radio systems have no means of subdividing the bulletins (which usually go by different names on other systems) into different categories or special interest areas. Therefore, users have to wade through everything from soup to nuts (especially the latter!) to find the few items of interest to them. This wastes time and precious channel bandwidth. One partial solution to the problem is to use the To: field of bulletins to categorize them; then astute PBBS users can use commands like "L> XXXX" to find bulletins related to the area designated by "XXXX." KA1NNN has proposed a list of categories (as published in Gateway, Volume 6, Number 2, and also distributed on the PBBS circuit) and some categories are already in use in some areas. This is by no means a complete solution, but it is a good first step and one which PBBS SYSOPs should strongly support.

In considering what other changes might be made to the packet- radio bulletin distribution system, it is useful to examine how those other systems mentioned above handle similar tasks. I would like to focus on USENET because I believe it offers the most useful model from which we can learn, but there are certainly others worth examining, such as the Fidonet BBS network.

Although USENET is not a BBS, it has some notable similarities to the PBBS network. It has been described as "a kind of grass roots network based on controlled anarchy." Sound familiar? The network consists of more than 5000 computer sites, ranging from huge mainframes to lowly PCs. What they have in common is the UNIX operating system (or at least the ability to communicate with UNIX systems). In USENET, "bulletins" are articles posted by users of these systems and the articles collectively make up the USENET "news." The news is subdivided into approximately 300 different "newsgroups" and articles are propagated amongst the participating systems by a flood routing scheme very similar to that used for packet-radio bulletins. Of course, the medium of propagation is different, typically being telephone dial-up or leased lines, and the volume of news is considerably greater.

A USENET user accesses the news by logging into his host system and running a "newsreader" program. Most systems have several such programs available, each with a different user interface. They all make use of a configuration file in the user's home directory, which lists all of the newsgroups. For each newsgroup, this file indicates whether the user has "subscribed" to it (ie, whether the newsreader will show him articles from that newsgroup) and which article numbers he has read. While reading an article, the user has options such as sending a copy to a file or to a printer, posting a

follow-up article or sending private e-mail to the author.

Articles can also be posted without running the newsreader by using a different program, usually called "postnews." This is typically used when the article is not a follow-up to a previous article. The program first asks for a subject, then some key words that can be used for searching and then the name of the newsgroup in which to post it. More than one newsgroup can be selected ("cross-posting") in instances where the article's content spans several areas of interest. If the user is unsure of what newsgroups are available, the program can provide him with a list. The program then prompts for a distribution area for the article. There are usually about six choices (eg, local site only, metropolitan area, state or province, country, continent, worldwide); each newsgroup will have a pre-defined default distribution area which can be accepted by simply hitting Enter. Then the user is transferred to an editor to create the body of the article. Doing a follow-up article is easier because all of the preliminary details (newsgroup, key words, subject, distribution) are picked up from the article to which the user is replying.

One other interesting aspect of newsgroups is that some of them are moderated. This means that users are not allowed to post articles directly from their site into that group; instead, they must be mailed to a moderator, who posts them only after determining that the contents are actually a useful contribution to the discussion. This sounds like censorship, and moderated groups are in the minority on USENET, but a good moderator can really keep the noise level down and the quality level up.

(continued next message)

Volume 6 - Number 9 - January 19, 1990 - Part 3 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED
(continued from preceeding message)

Since there are a great number of USENET newsgroups running the gamut from highly technical and specialized to completely frivolous, a hierarchical naming system has been developed to make them easier to handle. A newsgroup name consists of two to four sections, separated by periods, proceeding left to right from the general to the specific. At the top of hierarchy are some broad topic areas such as "rec." (recreation/arts/leisure), "sci." (science and technology), and "comp." (computers). The newsgroup that deals with general topics of interest to hams is rec.ham-radio, but there is also a more specific newsgroup devoted to packet radio, known as rec.ham-radio.packet. The group for discussing IBM PC compatibles is comp.sys.ibm-pc, and so on. A few of the newsgroup names indicate geographical or institutional areas rather than topic areas. Since many of the USENET sites do not want to carry all of the newsgroups, the hierarchical naming system makes it much easier to specify which groups will be accepted by a particular site.

An interesting aspect of the anarchic nature of USENET is the way in which new newsgroups are created. There is no central authority to organize such

things, so it is up to the initiative of individual users to start the process. Proposals for new newsgroups are discussed, often heatedly, in a particular newsgroup which was created for that purpose. After a suitable period, if there appears to be enough support for the new group, someone will begin collecting votes, which are sent in by e-mail. After the prescribed period, the results are posted to the net, usually accompanied by a list of the voters and how they voted. If there are at least one hundred more "yes" votes than "no" votes, the newsgroup is declared to be created. Control messages are sent out, which cause the Netnews software to automatically add the new newsgroup to the USENET distribution. Most users will have their newsreaders configured so that they will see new newsgroups when they appear. They then can "unsubscribe" if they do not wish to continue reading the new additions.

How does this relate to the PBBS network? There are obviously some aspects of USENET which don't apply, but there are also some useful lessons we can learn. The notion of newsgroups is embodied in the To: field categories mentioned earlier. The limitation of six characters should be removed, possibly making way for a hierarchical naming scheme. The naming of the newsgroups will probably continue to evolve haphazardly for a while with some catching on and becoming popular and others falling by the wayside through lack of use. At some point, it would be desirable to formalize the list of existing newsgroups, and institute some sort of voting procedure for adding new ones. Since the packet-radio news network will presumably continue to emphasize topics related to ham radio, as opposed to everything under the sun as on USENET, I don't expect that the number of newsgroups needed will be nearly as large.

The other important aspect of bulletin/news distribution is the geographical distribution areas, which belong in the @PBBS field of bulletin-type messages. I would like to see a clean division between newsgroups and distribution areas so that the @PBBS field is used for the latter function only. This means that bulletins that are presently distributed to ALL@AMSAT, for instance, would instead be addressed to AMSAT@ALLBBS or, perhaps, SPACE@ALLBBS. If you were entering news on satellite passes in your own area, you would then address it to SPACE@LOCAL (where LOCAL is replaced by whatever is appropriate for distribution in your area). I believe that half a dozen or so distribution areas, ranging from local to worldwide, is all we really need in the @PBBS field. This would be supplemented by a file listing all of the newsgroups, along with various attributes which control how they should be handled by the PBBS.

Among the possible attributes for a given newsgroup are: don't accept articles for that newsgroup; accept articles, but don't retain them locally (for feeding other PBBSs who want that newsgroup); accept articles and make them available to users; archive articles in that group into a text file, etc. The newsgroup file would also be referenced for forwarding purposes, if there is a need to forward only selected newsgroups to other PBBSs.

In order to effectively manage the news (I'd like to get away from calling it "bulletins"), some major changes in the PBBS software is needed. There

should be more help available to users entering news articles, so that they can easily get a list of available newsgroups and distribution areas that can be used. The SYSOP needs tools which allows him or her to define these items and also to establish linkages between them which can be used to prevent inappropriate distribution. It should be possible, for example, for the SYSOP to set a limit on distribution area for "for sale" items, and thus prevent the 4SALE@ALLBBS sort of abuse that we have been seeing lately. It should also be possible to set up controls so that articles from users that have very wide distribution are flagged and put on hold so that the SYSOP can review them before deciding whether they should be unleashed on the world. This adds a burden to the SYSOP, but seems to be the only solution to curbing the abuse we are currently experiencing. The situation should improve in time, as the level of user education improves.

Volume 6 - Number 9 - January 19, 1990 - Part 4 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED
(continued from preceeding message)

Another control which is needed is the ability to flag a given newsgroup as "moderated." In such cases, users would not be allowed to post articles directly to that newsgroup. Instead, they would get a message giving them the name and e-mail address of the moderator for that group and be allowed to mail the article to the moderator if they wish to continue.

For reading the news, the PBBS user interface should provide some of the functions of the USENET newsreaders. The most important function is the ability to allow users to select which newsgroups they want to see. The selection, along with other preferences, would then be part of the user profile stored in the user file. There would be at least one obligatory newsgroup for important local announcements, which cannot be unsubscribed. The news should be kept entirely separate from mail, the two areas being entered with different commands.

In general, the user interface should not only make it easier to selectively find and read news items, but also to interact with them by facilitating the process of responding to them. For instance, the PBBS Send commands should be supplemented with a Follow-up command which would accept as an argument, a message number. It would create a new news article having the same newsgroup, distribution, and subject (prefixed by "Re:" if it isn't already) and the user just has to enter the text. Some means of tracking message threads would be handy too (or at least a command to list articles having the same subject as a particular article). One of the reasons I don't like the term "bulletin" is that it implies a one-way flow of news. I want to see more interactive discussions taking place by means of the PBBS network and software which facilitates such interaction.

There are many possibilities for enhancing the news reading interface, but the important thing right now is to start the evolutionary process in the right direction. Start using the To: field categories which have been suggested, along with others that appear as needed. After this usage has become well entrenched, we can try to standardize a basic set of

newsgroups, a method for adding new ones and discuss how the newsgroup name field might best be extended. At the same time, we should only use the @PBBS field for geographical distribution areas. Then the PBBS software writers can have at it and create some of the new tools we need to make the news distribution system work the way it should.

The PBBS network provides a very useful e-mail service for its users, but the bulletin distribution system is degenerating into chaos. We have an opportunity to build it into a truly useful system for distributing and exchanging information, but we must act now. Let's get on with the job!

Comments are welcome.

AMATEUR SATELLITE LAUNCH IMMINENT

All seven payloads: four MicroSats, two UoSATs and the primary SPOT-2 payload have been integrated and encapsulated in their payload structure in preparation for launch this month. The SPOT-2 has also been fully fueled and all are awaiting mating with the Arianne vehicle which will occur in a few days.

The MicroSat batteries are being trickle-charged, 10 hours on and 14 hours off per day, by Dave Cowdin, WD0/HHU, who will be in Kourou through launch day. This is done so that the on-board computers will remain powered up to retain their software loads in preparation for early flight operations.

Although separation from the launcher physically connects power to the MicroSat transmitters, they will not actually be turned on until a few hours after launch by either NK6K operating W6TRW on the US West Coast or N4HY on the East Coast.

Rudimentary telemetry software for IBM PC and compatibles is being prepared at this time and will be available soon. Distribution will be first to command stations and Command Station Development Program members followed by availability from AMSAT Headquarters and various electronic sources. If you do not have your software in place on launch day, simply capture files of received data for later processing.

Monitor the following frequencies early in the mission:

LUSAT 437.150 PSK straight PSK transmitter
LUSAT-CW 437.125 CW modified character set
WEBERSAT 437.075 PSK raised-cosine transmitter
PACSAT 437.025 PSK raised-cosine transmitter
DOVE 145.825 FM packet radio

Monitoring the PSK signals will require an SSB receiver and a TNC 2 modified with a 1200-baud PSK demodulator. FM packet radio from DOVE may be monitored with an unmodified TNC and FM receiver. The LUSAT CW beacon

transmits telemetry values in Morse code with modified numeric characters to save CW transmitter power. In all cases, more information will be published as it becomes available from the spacecraft development team. Copy CW signals as heard and capture packet-radio telemetry into computer disk files for later processing.

Additional information including other downlink frequencies and the uplink frequencies will be released as "opening day" for each of the satellites nears.

from AMSAT News Service

PACKET RADIO STARS IN TREK FLICK

Several months ago, Harold Price, NK6K, challenged me to demodulate what he thought might be HF packets in the motion picture Star Trek IV. During the scene where Scotty is valiantly trying to beam both Chekov and Uhura back from the USS Enterprise, Scotty is having a hard time hearing them. One of the sources of interference appeared to Harold to be HF packet radio.

Always being one to rise to a challenge, I took on the job of doing some fancy Digital Signal Processing footwork. Almost from the first, I was certain that it must be an HF packet because my very first demodulation attempt clearly revealed flags before the start of a frame and end of frame. I knew it was HDLC of some variety.

Several things impeded the effort including Scotty's voice on top of the packets and some 20-meter SSB nearly on top of the signal. All of this had to be filtered out. I spent an hour of time on the Cray-2 at work and used the fanciest FSK demodulator I could write and I finally had the noisy baseband signal plotted on paper in front of me. I did my best to get an integral number of samples per baud as the signal was very noisy and, though the bits could be made out by eye, I could tell that it was going to take another hour of Cray-2 time to get the clock recovered and to make good bit decisions. In a couple of places, HDLC showed me what were clearly bit errors and these could be done by eye as well.

After the filtering and building a demodulator for the badly mistuned signal (it was almost 900 Hz below 'normal'), I took the bits to Phil Karn, KA9Q, and he decoded the NRZI data and proved beyond a shadow of a doubt that it was indeed an HF Amateur Radio packet. It was WA8ZCN-0 sending an RR for NR-3 to N6AEZ on 20 meters. I got Bill Harrigill, WA8ZCN, on the phone and he agrees that it was probably him. Thanks Harold for the challenge and Phil for the help.

Volume 6 - Number 8 - January 5, 1990 - Part 2 of 4

HIERARCHICAL ADDRESSING TIPS

More and more PBBSs are now supporting "H" Hierarchical addresses of the form K9DOG @ W3IWI.MD.USA. You can tell which PBBSs accept such addresses when you connect to them by looking at the SID (System ID). This is the

field like [MBL-5.13-H$] or [RLI- 11.6-CH$] where the H indicates that the PBBS accepts the expanded addresses.

Now for some "rules":

1. In the portion to the right of the "@" you still must supply a valid PBBS call sign if you use H addressing. Do not use H addressing for NTS messages (eg, ST 94321 @ NTSCA) or for bulletins (eg, SB ALL @ MDCPBBS $). You don't have to use H addressing for well-known PBBSs.

2. The fields to the right of the @ which are separated by periods are intended to be real, physical locations. The convention that is being followed is to use the two-letter state/province postal abbreviation. Examples in the US and Canada include MD for Maryland, PQ for Quebec, MI for Michigan, WA for Washington state and DC for Washington, DC.

Similar examples in foreign countries include MI for the Milano district of Italy and WA for the state of Western Australia.

3. This is followed by a three-letter country abbreviation following ISO standards (the same letter codes used during the Olympics). Examples are:

Argentina ARG Italy ITA
Australia AUS Japan JPN
Austria AUT South Africa ZAF
Brazil BRA Spain ESP
Canada CAN Sweden SWE
Chile CHL Switzerland CHE
West Germany DEU England GBR
Greece GRC United States USA
Indonesia IDN USSR SUN
Israel ISR

4. An optional continent code, like EU for Europe, NA for North America, AS for Asia, AU for Australia, may be added.

5. Addresses are assembled from left to right, smallest area to largest. Thus, my full address would be W3IWI@W3IWI.MD.USA.NA but for forwarding within this continent, W3IWI@W3IWI.MD or W3IWI.MD.USA would be adequate. From the examples given above, you must be careful of mail leaving the country since MI could be either Michigan or Milano. Thus I would need to address a message to my friend Luca in Milano as IW2ECL @ I2KBD.MI.ITA or IW2ECL @ I2KBD.MI.ITA.EU to avoid the message going to Michigan.

6. In some cases, you will see attempts to facilitate local distribution with an address like W6XYZ@N6VV.#NOCAL.CA.USA, where the #NOCAL may mean something in California, but is just passed through by PBBSs forwarding the mail out west. Such supplementary addresses are always preceded by a #. Don't try to be creative inventing new ones. A bad example is one user who invented the return address xxxxx@N4QQ.MDCPBBS.MD.USA.Z:21211 -- both the MDCPBBS and Z:21211 fields are bogus.

7. Don't use these addresses to try to force routing. A recent message sent to Washington state with the address xxxxx@WS7M.W3IWI played ping-pong for three days between the W3IWI and WB7DCH HF mail gateways.

8. The extended H address applies to the PBBS, not to the individual user. Thus, if K9DOG uses W3IWI, then his address is K9DOG@W3IWI.MD.USA, not K9DOG.MD.USA. The address for a Virginia user of WA3ZNW is N4PQR @ WA3ZNW.MD.USA and not N4PQR @ WA3ZNW.VA.USA since WA3ZNW is located in MD.

9. Remember you need to supply a correct address for mail. You should not worry about the route the mail takes. Don't try to force your mail to follow a particular path.

10.It is your responsibility to supply a good, clean, correct address and the packet-radio network will do its best to move the mail to its destination. Be careful about typographical errors. Here are some examples of what has happened: N0AN is not the same as NOAN (with the letter o). W1XYZ is not WIXYZ (with the letter i) nor is it WlXYZ (with a lower case L).

AUTOMATIC CONTROL OF HF DATA COMMUNICATIONS PROPOSED

On December 12, ARRL counsel Chris Imlay, N3AKD, filed a petition for rule making with the FCC seeking the adoption of rules to permit limited HF RTTY and data communication under automatic control. The 24-page petition draws on the experience gained during the past 2-1/2 years under the STA granted to the ARRL in mid-1987 permitting a limited number of packet-radio stations (known as "SKIPNET") to operate under automatic control on specific HF frequencies forming an organized "long haul" message forwarding network. The League's conclusion, based on this experience, is that the desirability of automatic operation on the HF bands has been firmly established and, in fact, is now an integral part of the normal Amateur Radio activity in all ITU Regions.

The ARRL's proposal seeks inclusion of automatically controlled AMTOR and Baudot as well as data modes. In the petition, ARRL says, "the feasibility of automatically controlled operation on AMTOR has been demonstrated by US amateurs operating under special temporary authority.

... AMTOR is more robust than is packet radio and is used to bridge difficult radio paths.
... Thus, its operations under automatic control is not only feasible, but necessary for the development and efficient operation of amateur networks.
... manually controlled Baudot RTTY 'mailboxes' (or MSOs) have been active in the Amateur Radio Service since the early 1980s.
... the software controlling the mailboxes has provisions which allow the interrogating station to ask for repeats. Manual control of these mailboxes

... is an unnecessary burden on the mailbox system operators.
... The technology and operational experience using each of these modes has matured to the point that this is now possible.
... the benefits of automatic operation are shared by amateur operators worldwide and are instantly available to provide public service during disasters."

The petition seeks designation of the following band segments as being available (not exclusively) for automatic control of RTTY and data transmissions: 3.605 to 3.615 MHz, 7.035 to 7.045 MHz, 10.140 to 10.150 MHz, 14.090 to 14.100 MHz, 18.100 to 18.110 MHz, 21.090 to 21.100 MHz, 24.920 to 24.930 MHz, 28.100 to 28.120 MHz.

In a separate letter to SKIPNET members, ARRL Executive Vice President Dave Sumner, K1ZZ, explained why these particular frequencies are suggested in ARRL's petition. Dave said that the ranges chosen in most bands are probably self-evident except for those in the 20- and 40-meter bands.

"The specific frequencies used by SKIPNET stations have shown it's possible to shoehorn in with other US users. But, we have received complaints from societies in other countries about HF packet-radio frequencies, particularly in the 20- and 40-meter bands.

"On 20 meters, nearly every other country operates phone in the 14.100-14.150 MHz range, and packet-radio operations in the lower part of that range have been a continual cause of concern to them. This has been the case in all ITU/IARU Regions including Region II -- the Americas. The fact that some of their own packet-radio operators use frequencies above 14.100 has not convinced the societies in other countries that this is a good place for packet radio. The worldwide consensus (with some reluctance on our part) is that packet radio should operate below 14.100. Of course, that puts pressure on the Baudot RTTYers and AMTOR RTTYers just below them in frequency and, ultimately, on the CW operations.

"On 40 meters, most countries have a narrower band -- only 7.0 to 7.1 MHz -- into which they must squeeze CW, RTTY, packet radio, phone and image communications. Around 7.040, or even as low as 7.030, is where their phone band starts. So, you can understand why there might be contention over packet radio and RTTY around 7.090.

"The frequency segments for each band were chosen after careful review of domestic and international implications. While we knew to begin with that there was no such thing as a "perfect fit," we had to try for a "best fit" solution. Please bear in mind that we now have a viable packet-radio network that is worldwide in scope. As such, we need to use frequencies that are compatible with the rest of the world. Even with the frequency segments chosen, there may still be the need for future adjustments, both by us and in other countries, to finally arrive at common segments for automatic operation.

"We anticipate that individuals may wish to suggest some changes in the frequency segments proposed by the League. We believe such input to be

helpful in cases where commentors take the time to consider the domestic and international implications of their proposals."

The FCC has not yet assigned an RM number to this petition.

Volume 6 - Number 8 - January 5, 1990 - Part 4 of 4

PACKET RADIO IN SAREX 1990 PLANS

The Shuttle Amateur Radio Experiment (SAREX) will have a big year in 1990. So much so, it has been dubbed "SAREX-90."

STS-35 Space Shuttle Columbia is scheduled for a lO-day mission, to be launched on the evening of April 26, 1990. Dr Ron Parise, WA4SIR, a Payload Specialist, has been cleared by NASA to operate voice and packet radio during his flight.

STS-37 Space Shuttle Atlantis is scheduled for a five-day mission to be launched June 4, 1990. Marine Corps Lt Col Ken Cameron, KB5AWP, the Pilot, has been authorized to operate voice, packet radio, slow-scan television and ATV.

Both flights will use the amateur 2-meter band. The equipment is now undergoing final testing at the Johnson Space Center in Houston. Packet-radio operations will be continuous for periods of about 12 hours daily. Voice and television operations will be dependent on the astronaut's work schedules; but early flight plans indicate that they should have an hour or more available daily.

The orbital track on both missions will be at an inclination of approximately 28.5 degrees. This southerly orbit will put most of the United States out of range during the times when the astronauts are available, so AMSAT plans to establish ground station networks over strategic locations to relay communications. Stations in Australia, South America, Mexico, and Africa are now being contacted by AMSAT. Japan also is under consideration. Each general area will be coordinated by a control station, which will be in direct contact with a key station, W5RRR, at the Johnson Space Center in Houston, Texas. They will use amateur satellites, short wave links and commercial facilities for the international hookup.

Communications will be broadcast by the key station and repeated to WA3NAN, at Goddard Space Flight Center, Washington, DC and to W6VIO, at the Jet Propulsion Lab in Pasadena, California. Broadcasts from these stations, and W1AW, will be heard on most amateur bands. Several VHF and UHF repeater groups plan to pick up and transmit the material. They will carry NASA Mission Commentary, frequent bulletins to advise listeners of astronaut planned transmissions and repetition of all amateur two-way voice and slow-scan TV transmissions with the spacecraft. Mission planning information also will be fed by computer from the Johnson Space Center to the coordinating stations to insure the accuracy of their bulletins of advice on when and where to tune in the spacecraft. W1AW will be used as a

media showcase, as will W5RRR.

In addition, a Teleconference Net is planned to feed most amateur repeater stations in the United States. These stations will permit easy access to schools. With the help of Amateur Radio club members and handheld equipment, students will be invited to share in the flights. They will even be able to talk directly to the astronauts at some locations!

This project is co-sponsored by the ARRL and AMSAT. ARRL is lead organization for information, education and support. AMSAT is lead for technical operations. The Johnson Space Center Amateur Radio Club is in charge of in-flight equipment and flight planning. The Motorola Radio Club in Illinois has provided specially built transceivers and antenna.

567. Even more about 6 meters (LONG)

Newsgroup: rec.ham-radio
Date: 1990-01-26 01:33:31 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9001260133.AA11840@cmr.ncsl.nist.gov>
Source record: 13920

This is extracted from a message I sent last July to someone who enquired about six meters. With the recent additional requests, I'm posting it for general information. Absolutely no endorsements are given, especially no endorsements from my employer.
****

Firstly, six is something of an acquired taste, I suppose. There is relatively little FM activity on six, and in any case I don't take part in it. I'm on the low end; the place where SSB/CW activity is concentrated. There is not much local rag-chewing on six. Except as mentioned below, there has been very little packet work on six.

Most of the SSB/CW operators on six are at least vaguely interested in radio propagation effects. One of the things that keeps many people on the band is that nearly every propagation mode know to hamdom happens on six at one time or another. It has held my interest for many years. Oh sure, I've done some operating on other bands, and have been pretty inactive for a year or so at times, but ....

OPERATION

Operation is mostly on SSB, but switching to CW is common for really weak sigs, and a few people operate nothing else. Per the FCC, SSB must be above 50.1 MHz. The DX calling frequency is 50.110 MHz. An attempt is underway to leave 50.100 to 50.125 clear from domestic QSOs, to give the DX stations a chance to be heard. With that in mind, a second (domestic) calling frequency of 50.125 MHz is in use. Only on the wildest of Es openings do you find SSB operation much above 50.200 MHz. On transatlantic opennings you find most French stations, and many of the Gs operating above 50.2 MHz. The are a few dozen CW propagation beacons in the 50.060 to 50.080 MHz region in the US, and others elsewhere around the world in the 50.0 - 50.1 range. As well as signal reports, most stations exchange "grid square" information. On VHF and up bands, the world has been divided in 1-degree lat x 2-degree long "squares" which start at the south pole and date line and "read right up". I am in FM19, for example - actually FM19JB, each major "field" (FM) being divided

10x10 into 100 squares (19) and each "square" being divided
20x20 into 400 subsquares (JB). European stations like
the subsquares; most US stations don't even know their
own. In any case, the "squares" and their VUCC awards
have been a wonderful interest builder, and have kept the
QSL printers in business! I've now worked almost 400 squares
on 6 since the "squares" business started on 1 January 1983.

RIGS

The equipment situation is easy to cover, so I'll do that
now. Probably 50% of the active stations have 80 to
150 W output, either from old Icom 551D s (the 551 is 10
W), or from solid-state (brick) amplifiers following the
many types of 10 W rigs. Perhaps 40% of the stations run
just 10 to 20 W, but most of them either get an amplifier
or drop out after a year or so. The remaining 10% have
either tube rigs such as the Drake TR-6, Swan 250 (too
drifty!), Heath SB110A (spurious sig 150 kHz or so from
output), or high-power amplifiers. The kilowatt is quite
rare on six (see below for why). The norm for "serious"
stations is the 150 W amplifier. Last July I went through
some of my grid-square cards for the station information
contained thereon. Note that some of these cards go back
six years and thus slight currently-available gear.
- "BAREFOOT" POWER - WITH AMPLIFIER
RIG <25W <100W >100W <kW kW
Drake TR6 7 2
Heath SB110 2 1
Homebrew 4 1 1
Icom 505 1
551 14 3 3
551D 21 2
560 2 1
Kenwood TS600 5 2 1
TS660 2 1
TS670 2 1
TS680 1
Swan 250 11 2
Transv/someHB 10 4
Yaesu FT620 6
FT625 6 2
FT690 3
FT726 4 1

TOTAL 56 25 21 12 15
(sum=102, 37 having < 25W, including amplifier)
(22 having 25-100W, incl. amplifier)
(43 having >100W, including amplifier)
I'm sure that this list slights the more recent rigs. It
merely reports what has been on the air 1983-1989. No

endorsements are given, your mileage may vary.

ANTENNAS

A beam is essentially necessary. Everyone is horizontally polarized, but cross-polarization doesn't matter for Es or F2. A few stations use 3-element beams, but a 4 or 5 element beam is so small that a LOT of people use them. Quite a few people have Cushcraft 6-element "Boomers". Mine really over-shadows the house with its 34-foot boom! There are a few other big beams, up to the M2 with a 50-foot boom, and the lunatic fringe stacks them, etc.. The higher the tower the better! RG8 or RG213 is plenty good enough cable for most people. Antenna-mounted preamps aren't needed. External noise is fairly high at 50 MHz. It overrides the front-end noise figure on about all the rigs on the market today unless you have a LOT of cable loss or a VERY quiet location.

Also from my cards: (largest beam = 44 elements!)
NUMBER OF ELEMENTS
<3 3 4 5 6 >6
this size 9 8 15 22 30 19
HEIGHT (FEET)
<26 26-55 56-100 >100
this height 10 35 18 3

PROPAGATION

Tropo - The ordinary ground-wave tropo range on six isn't quite as great as on two. There are a number of reasons. Since there are so many other prop modes on six, people don't try so hard on tropo. Antenna gain often is higher on two. Noise is lower on two. At least in the summer, stations like W3BWU (Pittsburgh), W3IDZ (northern NJ) are easily worked from here with the beam pointing at them, and can be heard at almost any pointing. They are in the 150-W class.

Meteors - Any area workable by meteors can be worked more easily by Es or aurora. Even though meteor sigs are much stronger and longer on six than on two, little use has been made of them. There has been a VERY little meteor-burst packet work on six. I had the first such contact (with W0RPK). W3XO worked him a few years later.

Ionoscatter - Some people think it's really meteors, but every weekend morning there are a number of nearly-kilowatt stations working each other on SSB at distances of about 600 - 1000 miles by ionosperic scatter. Sigs are weak, and it takes good beams, height, and power, but

it is very reliable. See the old NBS papers by Bailey, Bateman and Kirby, et al. Bateman and Kirby were/are hams. Ross Bateman died last year. Dick Kirby continues as head of CCIR in Geneva.

Aurora - Much easier than on two. SSB is usually intelligible. Point north about dusk, most commonly in March and October/November. Lots of people work this mode when it happens.

Es - You know something about Es from TV DXing and "short skip" on ten meters. Having much better antennas, modulation, and receivers, hams do a lot more with it on six than you are used to on channel two TV.
It is most common from May to August, and around Christmas, here in Northern latitudes. In addition to the common single-hop range of 500 - 1500 miles, there are quite a few double-and-more hop contacts on six. Now that a number of Europeans are on six (with LOW power), we find that they can be worked from the US east coast each summer. Likewise the Caribbean stations work all over the US. The US west coast has an easy time with Hawaii and Alaska.

F2 - This is the traditional world-wide F-layer propagation you know and love from 20 and 15 meters. At most sunspot maximum periods, a few years of each eleven, the MUF reaches above 50 MHz in the autumn and spring. It isn't every day, but even antipodal communication has happened. The leaders have now worked over 100 countries. But they have spent MANY hours over many years trying to catch the fleeting opening. F2 brings an influx of the lower-band DX operators. The normal rather gentle operating style gets somewhat lost at those times.

Transequatorial Propagation - The southern US gets a number of openings to South America by some kind of ionospherically-ducted propagation. The stations are generally about equidistant either side of the magnetic equator. Given exceptional luck, an Es opening linked into this mode can make it available to more northern stations. This mode has bad flutter fading and a touch of the auroral spectrum spreading. This mode also works sometimes on two meters if you use CW and really good gear. It has been worked on 432 MHz.

EME - There have been a few EME contacts on six, but the required extreme antenna size and transmitter power make it out of the reach of most people.

Did I leave any modes out?

TVI, ITV

There is no doubt about it, six has TVI troubles. You find a limited number of people on six in channel 2 areas unless cable is widely subscribed-to. Many VCRs and audio systems are also prone to six-meter pickup. The common connecting or power cable is a quarter-wave antenna for six .... The TV owners have their revenge since the 13th harmonic of the color subcarrier, or something, of TV sets and TV games puts out a birdy at 50.113 MHz to bother the six-meter operators in return.... There is also quite a bit of trouble from noisy power distribution lines if they aren't buried (usually bad insulators or poor guy bonding).

STILL INTERESTED?

That should be enough to hold you for a while. Listen to 28.885 MHz, the ten-meter liaison frequency for overseas six-meter DX.

73,
Bob W3OTC
WAS (#638), WAC, and 66 countries on six.

568. Request for info ... solar sails.

Read in recent Scientific American (Apr 89) about a solar sail race, a race in space for light crafts powered by the photon pressures.. Three entries are being planned etc. One each from Europe, Asia, and America.

I remember a blurb in a QST long time back about Ham interst in Solar Sails, for the amateur sattelites .. are any Hams involved in this too ?

The article also mentions India, among the countries with active groups working on solar sails. Anyone have pointers to such people in India ?

e-QSL (or post if thers is sufficient interest) . 73 es GB.

And if the exchanges find out that you have been recieving the data, they will come after you directly for theft. The exchanges are considered a quasi-govermental agency, and they *will* prosecute. Also, if you have executed any trades using this information, there are additional penalties. In theory, you could avoid this by paying the exchange fees. However, since the forms that must be filled out for the exchange fees include sections for *how* you are recieving the data, filling in "Intercepted from FNN Signal transmissions" would likely get you in hot water.

You might ask how you would be caught. And I don't have an answer for that. I do know that it wont go well for you if they do catch you, since the least you will have to do is pay all of the past fees you skipped on -- which are about $100+ a month PER EXCHANGE.

The FNN Signal broadcasts are encrypted, but I believe the method is trivial to crack. You will need to work out the transmission formats, which are much more complex.

Just a word of warning...

>hydrochloric acid in the cells (like from a car battery)? It says on
>the side of the battery that it is a rechargeable alkaline battery,

The first NiCd rechargeable batteries (late sixties?) were called
"rechargeable alkaline" batteries. The cells you describe are the
wet-cell type, which is not terribly common nowadays. The electrolyte
was either lye (sodium hydroxide) or the similar potassium hydroxide
or lithium hydroxide. The wet cells are not common because the stuff
is nasty if it leaks.
Assuming it's dried out (not leaked), you should be able to
just add distilled water. The hydroxide can turn to oxide in some
situations, so this may not work, but it's easy to try.
To the best of my knowledge, the electrolyte of choice is
about 30% potassium hydroxide.
C&H Sales has a variety of (military surplus) batteries
and cells of this sort: 1 7/8"x6" per cell, 4 amp-hours, 1.2volts
per cell (#NCB8200, $3 each) and 2 5/16" x 1 1/8" x 6", 14 amp-hours,
1.2 volts per cell (#NCB7600, $5 each) are typical.
Their phone # is (800) 325-9465; get a catalog from them and see
if something looks familiar.

I am known for my brilliance, John Whitmore

I am getting pretty tempted to buy one of these new breed of
digitizing 'scopes that HP and Tek are offering. They claim
anywhere from 250 -> 500 MS/s for basically very low cost.
The question is: are these instruments really useful for
medium -> high speed logic work, eg say I want to look at
video coming off a graphics board at 158 mHz. Comparable
analog scopes run twice as much per bandwidth dollar, so
some flags are raised in my mind ie you don't get something
for nothing. Would appreciate any hearing any experiences people
have had with eg the Tek 2431 or any of the HP low end gear. I would
be particularly interested in hearing from people that have
used such 'scopes in RF work.

Thanks,

I've heard about two on-going DSP projects for amateur radio use. Seems AEA is working on something and so is TAPR-- I'm sure Mr. Quiktrak, N4HY, can tell us about the status of the AEA project...but how's the TAPR one coming along?

I'm wondering if these units will have the necessary firmware/ software to do the demod. of the data from the Microsats-- or will the AEA box initially only do HF things like RTTY, AMTOR and PACKET? (I'm guessing at this...since it's called DSP-232 which seems to imply replacement of PK-232).

I've been putting off the purchase of the dedicated PSK modems since the DSPs look like they could be the ideal solution to having to have a half dozen different modems in the shack.

Any ideas?

>$50 TNC, and the terminal / computer of your choice, you can copy the
>telemetry and bulletins from the DOVE Microsat. Really! Just take your
>packet station, and put it on 145.825 MHz.

I guess I just wasn't paying attention before the launch, because I hadn't realized that DOVE could be copied with a standard TNC. Paul is right--just dial up the frequency and wait. (If you don't want to wait 24 hours or run orbital elements, try 10 p.m. and 11 a.m. +/- 2 hrs. as one of the AMSAT folks suggested.)

And to echo Terry Bell's comments in r.h-r.packet, the KA9Q TCP/IP software works great for this. I think a lot of people believe that Phil's package is only for TCP/IP. Not so! It's also a full-blown AX.25 package. I use it for everything. Anyway, the last pass of DOVE is still sitting on my Mac's screen; next pass should be in a little while. Just waitin' for the little puppy to come over the horizon...

Like Paul says--try it!!

73,
Patty

p.s. I followed up in rec.ham-radio because I suspect that some people who don't read .packet might get more interested in the subject after Paul's posting. But I'm recommending extended followups to r.h-r.p.

SB ALL @ AMSAT $ANS-023.01
SUCCESSFUL LAUNCH OF SIX NEW AMATEUR RADIO SATELLITES

HR AMSAT NEWS SERVICE BULLETIN 023.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

After nearly three years of hard work by scores of dedicated AMSAT volunteers, there are finally six new amateur satellites in orbit. At 01:35:31 UTC on January 22, 1990, ESA successfully launched it's V35 mission, an Ariane 4 booster, from its launch facility in Kourou, French Guiana. On board were six amateur radio satellites, two built by the University of Surrey, UO14 and UO15 and four microsats built by AMSAT-NA, AO16, AO17, AO18, AO19. An errant tape recorder on the primary payload, SPOT-2 delayed the launch from January 9th and bad weather in the area brought about a scrub of the launch on January 21. However, the picture perfect launch occured at the beginning of the ten minute launch window Sunday evening local time.

The AMSAT Launch Information Network Service (ALINS) brought the launch "live" to thousand of amateurs and interested on-lookers world wide. Doug Loughmiller, KO5I, President of AMSAT-NA, anchored the net which could be heard on the ham bands covering 160 meters all the way up to AO10 and AO13. Also heard on the ALINS net were a number of the major contributors to this latest effort. Commentary prior to the launch was offered by Tom Clark, W3IWI, Jan King W3GEY, Martin Sweeting, G3YJO, Jeff Ward G0/K8KA, Harold Price NK6K, Dave Cowdin WD0HHU and Bob McGwire N4HY. It was noted that this was also an anniversary for the ALINS net. It was twenty years ago, on January 23, 1970, when the first ALINS net covered the launch of Australius-OSCAR 5.

Doug Loughmiller, watching the ESA video feed of the launch, counted down to ignition and liftoff. AMSAT's Dave Cowdin, who had been at the launch site for over 5 weeks gave updates on the progress of the mission from his position at ESA mission control. At about three minutes into powered flight (during the second stage burn), the launch commentary ceased. For over a minute, neither Dave Cowdin or Tom Clark, who was monitoring the launch from the NASA Goddard Space Flight Center in Greenbelt MD offered any information. This silence had certainly activated the adrenaline glands and stopped the breathing of those who were listening. One voice offered some comfort, explaining that ESA had never had a second stage failure in any of its missions. Finally Dave's voice

came through indicating that all systems were "still GO" --- and with that message, those listening could begin to breath again. As part of the elation felt by the development team, Harold Price (a member of the software team) indicated his delight in recognizing that the satellites were no longer within the grasp of the hardware team, and that the satellites were "all theirs".

At 20:04 minutes of mission elapsed time, ESA issued a payload separation command to its launch vehicle and UO14 and UO15 were freed. A minute and a half later at 21:29 mission elapsed time, ESA issued two more payload separation commands and AO16, AO17, AO18, AO19 were released. Dave Cowdin reported that the six separation lights were "All Green" indicating confirmation that all six Amateur Satellites had successfully separated from the launch vehicle.

Dave Cowdin indicated that AMSAT was treated in a most professional manner by ESA. Although the primary payload, SPOT-2, (a $100 million observation satellite) was ESA's primary concern, applause from ESA mission control could be heard over the ALINS net as the six satellites were separated from the main launch vehicle.

During the first orbit, AMSAT-LU in Buenos Aires commanded the CW beacon to commence transmitting, and it provided vital temperature and battery voltage information to the satellite command team. Although attempts by N4HY to turn on the PSK telemetry beacons during orbit 1 were unsuccessful, all of the Microsats were transmitting by the end of the last pass (orbit 3) over the west coast, around 0700. Spacecraft engineers Harold Price and Jan King, operating from W6TRW, indicated that the satellites had either responded to ground command or had switched on transmitters automatically in order to prevent battery overcharging. WEBERSAT was succesfully commanded on from Weber State College in Ogden, Utah during orbit 2. UO-14 and 15 were activated during the first opportunity visible from the University of Surrey on orbit 5.

PRE-LAUNCH MICROSAT KEPLERIAN ELEMENT SET

HR AMSAT NEWS SERVICE BULLETIN 023.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

SPOT-2 / MICROSAT / UOSAT KEPLERIAN ELEMENT SET

The following element, originally provided by ESA as relayed by N4HY has been modified by W2RS to more closely predict observed AOS and LOS times:

Satellite: SPOT-2, UO-D, E, Microsat-A, B, C, D
Catalog number:
Epoch time: 90022.0778588
Element set: Kourou-1
Inclination: 98.73 deg
RA of node: 97.9558 deg

Eccentricity: 0.0013
Arg of perigee: 93.9 deg
Mean anomaly: 302.31 deg
Mean motion 14.28575 rev/day
Decay rate: 1.0e-05 rev/day^2
Epoch rev: 0
Appogee 816.0 km
Perigee 798.1 km

The following element set for PACSAT was provided by RGO via G3AAJ.

Satellite: AO-16
Catalog number:
Epoch time: 90022.77211779
Element set: RGO
Inclination: 98.7092 deg
RA of node: 99.2408 deg
Eccentricity: 0.0003323
Arg of perigee: 185.4669 deg
Mean anomaly: 178.4316 deg
Mean motion 14.28180195 rev/day
Decay rate 7.9248e-04 rev/day^2
Epoch rev: 10

Whatever element set you are using, allow some tolerance in pass times
and antenna pointing until information starts to become available from
the standard sources.

SB ALL @ AMSAT $ANS-023.03
MICROSAT AND UOSAT FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 023.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

MICROSAT AND UOSAT FREQUENCIES AND DEPLOYMENT ORDER

The following are the Microsat and UoSat listening frequencies,
data rates, and modes for the first few weeks of operation and
check out.

Spacecraft OSCAR number Frequency, MHz Mode

UoSat D UO-14 435.070 1200 bps AFSK (FM)
UoSAT E UO-15 435.120 1200 bps AFSK (FM)
PACSAT AO-16 437.025 1200 bps PSK AX.25
DOVE AO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT AO-18 437.075 1200 bps PSK AX.25
LUSAT AO-19 437.150 1200 bps PSK AX.25
LUSAT - CW LUSAT 437.125 12 WPM CW telemetry

Packet transmission from DOVE may be monitored with an unmodified TNC-2 or clone, using an FM receiver. The other microsats (PACSAT, WEBERSAT, and LUSAT) require an SSB receiver and TNC with a 1200 bps PSK demodulator (FO-12 compatible, NOT the 400 bps PSK demodulator used with AO-10 and AO-13). The modulation scheme used by the UoSats is compatible with UO-11.

PREPARATION FOR SAREX OPERATIONS WELL UNDERWAY

HR AMSAT NEWS SERVICE BULLETIN 023.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

Although the past few months have seen much attention focused on the Microsat/UOSAT launch, there is yet another amateur space spectacular to take note of. In April Ron Parise (WA4SIR) will be an astronaut on the next flight of the shuttle Columbia. Ron will be flying a SAREX (Shuttle Amateur Radio EXperiment) payload.

Ron will be taking the Motorola HT plus packet hardware. The SAREX packet hardware is a 1990 version of what we had hoped to fly in 1986 when the Challenger disaster caused a schedule setback. In 1986, we planned a radiation-hardened 16K TNC2 -- the 1990 version is a radiation-hardened Heath/Tasco HK-21 "Pocket Packet" with 32k of RAM. The Support computer has evolved from a small Radio Shack Model-100 (which we would have had to provide) to a Grid laptop PC clone (which is a standard item on the orbiter).

For the 1986 mission we had planned a "ROBOT" QSO machine which could work up to 9 people simultaneously, which had the capability for sending a long (1.7 kbyte) "Meta-beacon" and which could also be used as a "normal" TNC if there were real time QSOs. The 1986 firmware was tested in several locations and on two aircraft tests and proved to be very robust. The 1990 SAREX TNC firmware is an updated version of the earlier code. The major functional change is that the TNC now has enough RAM to store 650 QSOs, which in turn solves a major operational problem that would have existed in 1986 when the "worked" logs would have had to be downlinked in real time and assembled from beacons. As with the earlier software, stations only appear in the "worked" log the first time they complete a QSO -- no dupes! There has also been a minor change in the dupe definition in that the log drops any SSID, so a QSO with K9DOG-4 is a dupe if K9DOG has been worked earlier.

During the winter of 1985/6 there was a lot of interest in having SAREX demo stations in several parts of the country. Those stations who would like to offer their services a demo station should contact Tom Clark, W3IWI, or Courtney Duncan, N5BF, through AMSAT Headquarters.

SB ALL @ AMSAT $ANS-023.06
MICROSAT'S EDAC COUNTER REFERENCES SET

HR AMSAT NEWS SERVICE BULLETIN 023.06 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

The current early orbit software for the four Microsats does not record EDAC errors (Error Detection And Correction circuitry for the on-board memory), it only reports the status of the EDAC counter. The counter comes up in a random state when power is first applied. To determine the number of EDAC errors occuring during the first few days, the values of the counters at initial power up are listed here:

DOVE: 0xaa LUSAT: 0x0b PACSAT: 0xd8 WEBER: 0x22

Note that a large count value does not necessarily indicate a large number of radiation hits. Counters are incremented each time effected bytes are read from memory, but are only corrected when those bytes are written to memory during a memory wash cycle or ordinary data manipulations. If an effected byte is located in a part of software that is executed many times, many errors may be registered before the wash correction occurs.

I hope that the folks that need this telemetry can use this. Did I miss the publication of how the decoding is done? If anyone can list the 59 different channels in the TLM packet, it would be fantastic.

This stuff is really accessable & quite fun!! THANKS to all that worked on the new birds!

Subj: microsat elements

Here's a set of elements for what are being called 1990 005A and 1990 005H, since they were not included in Max White's list. These came from Kelso's Celestial BBS.

1990 005A
1 20436U 90 5 A 90 23.82409993 .00004306 00000-0 17953-2 0 77
2 20436 98.7217 100.2931 0003389 178.5625 181.5624 14.26691687 258
1990 005H
1 20443U 90 5 H 90 23.82219061 -.00030107 00000-0 -12187-1 0 73
2 20443 98.7165 100.2885 0010048 210.8523 149.2068 14.28223237 250

I didn't include his other sets because the ones Max White provided have later epochs.

I wouldn't make ANY assumptions about which of the 8 element sets correspond to which real objects, including SPOT and the launcher. At the moment 005B is well ahead of the pack and 005A is well behind, with the others bunched in the middle. C and E look almost identical. I'm not sure what all this tells us, since I don't know what maneuvers (if any) were done by SPOT and the launcher after separation, nor do I know the precise velocity vector of each separation.

If we could get radar cross section data we could narrow things down, but lacking this we'll have to wait for all the objects to spread out. Then we can tell NORAD which is which. (I note, rather wryly, that they're part of the same organization that says they'll have no problem telling, with absolute reliability, the difference between an incoming nuclear warhead and a decoy in a matter of minutes...but I digress. :-))

Subj: First Microsat program load

The first post-launch software was uploaded to WEBERSAT this evening. The upload was started on the east coast by N4HY and completed by NK6K @ W6TRW on the west coast. We'll use this technique of uploading large programs over several passes by multiple command stations to counter the relatively short access times.

During the first pass over LA, the satellite was getting perfect copy
of 152-byte packets while it was still near the horizon, with
25 watts into a klm-22c. We didn't try to see how low with RF we could go, as
we wanted to get the software in. It appears that the satellites will be
as easy to get into as we hoped. Receiver sensitivity and channel centers
will be calibrated in the days to come.

An improved loader in now running on WEBERSAT, although the new battery
control algorithm is not yet loaded.

The weber transmitter was off from Fri Jan 26 05:06:30 1990 UTC until
Thu Jan 26 06:37:06 1990 UTC. The UTC date on weber was set to 1989
by mistake, this will be corrected in the morning.

We are still in the process of installing factory field upgrades to
webersat in preparation of turning it over to the "customer" sometime
next week.

579. J-pole Antennas.

Newsgroup: rec.ham-radio
Date: 1990-01-26 10:22:42 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <26.Jan.90.10
Source record: 13932

The J-pole: yes it is esentially a 1/2 wave element with
a 1/4 wave matching stub at the base. As to the end impedance of a 1/2 wave,
well, there have been various claims for this, ranging between 500 and 5000
ohms.... There will be numerous factors affecting this - whether the element
is in free-space or not, the ratio of length to diameter of the element
(make it out of wire and its impedance will be higher than if it is of
large cross-section).
A 'fat' element will also have a wider bandwidth.
I have used 1/2 wave elements fed with conventional transformer matching,
i guessed the approximate ratio as being something like 15:1 and moved the
tap on the transformer to get maximum radiated field-strength.... It
worked!.
Remember, the *calculated* impedance and the *actual* impedance are only
ever the same if you are in free space (in other words theres nothing for
thousands of wavelengths in any direction...)

Anyone who expects to design and build an antenna and have it work 'straight
out of the computer', is grossly optimistic. Only fools calculate their
impedances, then expect to see a real antenna fit the theory!

If interested in the 'j-pole', also look up the 'Slim Jim' (a sort of
'folded j-pole') designed by Fred Judd G2BCX. It is about the same size as
the traditional j-pole, but about one and a half dB more efficient.

580. 6 meters

Newsgroup: rec.ham-radio
Date: 1990-01-26 11:20:29 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9001270804.AA22846@ucbvax.Berkeley.EDU>
Source record: 13933

In a recent posting, "Dr. MegaByte" asked about usage of the 50-54 MHz (6 meter) band. I would like to echo the response made by Jim, AD1C: Yes, 6 meters is very heavily used and is extremely popular among VHFers. I'll bet that over 90% of the weak-signal (i.e. SSB/CW, non-FM, non-ATV) VHFers have 6-meter gear.

You may _perceive_ that 6 meters is unoccupied for several reasons. First, its activity is strongly seasonal. E-layer propagation is about nil during most of the winter, so many 6-meter ops don't get on the air except during the summer. Second, the "ground-wave" [bad term, I know...] range on 6 meters is not great, so unless you live within about 50-75 miles of an active station, you may not hear much day-to-day activity. Lastly, it takes a beam antenna to get good results on 6 (just like on the higher VHF bands). So if you're a casual listener, perhaps using just a scanner and vertical antenna, you will not hear much of the activity that's actually there.

6 meters is VERY alive and VERY well, thanks to recent F2 DX openings to Europe, Japan, and S. America. Concentrate your listening in the range 50.1 - 50.150 (especially .110 and .125) and you may get a case of 6-meter fever, too.

Mike Owen, W9IP/2

-< info from Japanese magazine >-

I just find a report of the IC-R1 on 'Radio Life' that is a Japanese
magazine for SWL (also for air,police,other utility band listening and
modification of HAM transceiver for wide band receiving).

The following are points of this report.

o IC-R1 has gain about -5dB(max. SINAD) in above VHF band.
o IC-R1 works well only in warranted freq. (2MHz - 905MHz).
IC-R1 doesn't work well in below 1.4MHz (MW band) and above 1.2GHz.
o The bundled antenna is matched at about 150/400/850MHz bands.
So, if you want to enjoy overseas broadcasting services, you have to
prepare an antenna for HF band.
o IC-R1 is weak in overload and image QRM. If you'll use high gain
antenna, you'll receive unwanted waves at the same time.

RELAYED FROM DECNET

583. ARRL January VHF Test

Newsgroup: rec.ham-radio
Date: 1990-01-26 15:59:00 UTC
From: zwirko%v5120.decnet@nrl3.arpa
Message-ID: <9001270806.AA23146@ucbvax.Berkeley.EDU>
Source record: 13938

More observations of the ARRL January VHF SS (1-20/21):

Here in the Maryland D.C. area conditions were reported to be poor on all bands. 6m offered only a few meteor scatter contacts, while 2m and up offered only some slight enhancements to the south and west...At this QTH New England and W. NY were barely heard, which was highly unusual. Unfortunately no Aurora this far south on Sunday evening.
Some best DX on the various bands from FM18 were:
6m - K5CM (EM25) & WA0BWE (EN34)
2m - N4EQT (EM77) & VE3ASO (FN25)
70cm - VE3ASO (FN25) & K4LVV (EM96)

We were all quite fortunate here in the Mid-Atlantic, not to be hit by the ice/snow which plagued those north of us. As a matter of fact it was partly sunny on Sunday with temps. in the mid-50's.

The rough setup here was 300W & 6L@35' on 6m, 300W & 19L@40' on 2m and KW & 27L@ 45' on 70cm (lost my GasFet mid-test).

I, also like Dave (KM3T), used the K1EA ConTest logging program, which really is a pleasure! The 3Band score is as follows:

Band QSO QSO Points Grids
50 142 142 32
144 229 229 34
432 92 184 19

---
463 555 85 ------> 47,175 points

Some other (rumored) point scores from 5Band op's here in MD were:

K1RZ - 105.1K
NW5E - 93.9K
W3IP - 86.7K
W3ZZ - 81.2K

I fly R/C and use 6 meters on some of my systems. Since the imports ran US companies under the table, it is tough to find 6 meter systems.

I got mine from Royal Electronics, in Denver, which no longer makes systems. I have quite a few spare servo gears, etc, so manage to keep them alive.

At this point in time, the only US manufacturer that I know of who might assist you in this is ACE R/C, in Higginsville, MO. I am at work and do not have any magazines handy, but I would think that if you called information, got their phone number and called, you could find out what is available.

ACE has kits, and the last time I knew, they still carried 6 meter equipment. As far as conversion of equipment on the market, I do not feel it would be worth it, I have built homebrew R/C hardware in the past and it gets costly to get the correct coil forms, crystals, etc, that fits the existing boards that you would find in the systems, especially when you are buying in low quantity. Additionally, all systems in this country (most anyway) come from across the pond and US parts just do not have the same sizes, etc.

Brian is quite correct. The DOVE-1 does NOT listen to 145.825. It will never be a packet radio digipeater or any of that stuff. In the VERY NEXT upload, messages will be sent which tell the poor folks who are suffering from our lack of pre-flight publicity, that 145.825 Mhz is in the Amateur Space allocation and that this is an educational satellite. It is just so loud people don't realize that it is a satellite. Hell, it is louder than most of the digi's I connect to around here.

Well, I just got the latest poop on the display upgrade for the Kenwood TM-721A and the TM-621A....

Now it is MARCH! These guys are unbelievable... When I asked why the delay, they said that "sometimes it is hard to schedule production"...

Wow! How profound, they have been trying to build this modules since before October and they still can not do it... I work at an engineering company, and to miss a schedule by more than 6 months is pretty amazing.

Does anyone have a name/number/address of some important person at Kenwood to discuss this with?

Thanks in advance!

While I must agree on the general sentiments expressed about VHF/UHF conditions
here in the East there was a brief F layer opening around noon Sunday to California. While
my station isn't exactly in the class of K1TRs I did manage a few
6 land QSOs. Other well equipped locals made perhaps 6 to 8 QSOs.

The upper end of the J pole is a HALF wave, NOT a quarter wave (approximately) so the A:B impedence is going to be very high. You can't feed there without a matching network. The lower part of the J pole *IS* your matching network.

This is the way things seem to work in Japan. Because of the committment the companies make to their employees (you have a job for life), they must make sure they don't overextend their production lines, because that means hiring people that they cannot simply "let go" as so often happens in this country when the production needs drop. So they keep their production line running all the time, and generally have a queue of things to be made.

What does happen at times, I understand, is that different companies will contract with each other for production. I don't know if small parts would warrant doing that.

> Does anyone have a name/number/address of some important person at Kenwood
> to discuss this with?

Kenwood doesn't have important people. I was told this by an unimportant person at Kenwood. This is why I no longer buy Kenwood.

Pretty wierd. Might be the "solder alone isn't enough" line of reasoning.

> Why does the clamp need to be weatherproofed, George (or anyone)?

Cause a little moisture/dirt/acid rain will chew thru the copper flashing on the RS rods and clamps in short order. Keep the mosisture out and you'll be better off. If you got heavy copper plating and a good enough wire/clamp to obtain "gas tight" contact, then one needn't bother.

Having just acquired a CB radio to convert to 10 meter Ham use, I would like to ask if anyone knows where I can get a uPD858 PLL/synthesizer chip. It is manufactured by NEC. I have one catalog that lists a uPD857, and a uPD861, but no 858 -- is it still manufactured? The Sylvania ECG 1198 is supposed to be a substitute. Failing finding the real thing, does anyone have a data sheet for it, and suggestions for substituting another chip on an adaptor board (it puts out a 0=lock signal, unlike most other PLLs, just to be difficult...).

Thanks much in advance,
John Woods, WB7EEL

c.>3) LOTS of memory available. Certainly 100 frequencies or more is
c.> not too much to expect.

RE: The Pro-2005 scanner.

The 2005 is basically the same as the 2004, except it has "real"
keys, not the membrane type. It's still easily modifiable to
receive CMT and increase the scanning speed. The 2004/2005 operate
from roughly 25 MHz to 1300 MHz continuously (with modifications)
except for the UHF TV channels, somewhere around 700 MHz or so. I
forget right off hand, grin. Oddly enough, the prior 2003 covered
part of the lower UHF channels, but coverage ended about 512 MHz.
Together, they cover almost everything. With modifications, the
Pro-2004 will hold 400 channels. I think the 2005 needs no mods
for that. The 2004 has ten search banks, meaning you can search
10 frequency ranges without a lot of programming. It has AM,
NBFM and WBFM. No SSB.

c.>4) A good search capacity allowing for variable search increments. ie:
c.> 12.5 khs 5 khz etc.

Yes. On CMT, you can search in 30 kHz steps. I think it has 5, 12.5,
30, and 50 kHz steps.

c.>2) A (good quality) backlight.

Yes. The 2004 has two positions, high and low. Wish they had "off,"
as I like to lie in bed at night and listen. Even the low position
is blinding. I covered a thin piece of cardboard with black
electrical tape and cut it to fit in the scanner's "window."

c.>3) The ability to run off of 12 volts. (For automobile use.)

Yes, but the 2004 has no mounting capability. Why the 12 volts then?
Dunno. I keep two 6-volt lantern batteries and a modified cigarette
lighter power cord wired up. We had a massive ice storm about 6 years
ago, and the power was out for a week. Emergency radio power is
MANDATORY.

c.>1) More than one antenna jack.
c.>4) An S-meter.
c.>5) A built in recording jack.
c.>6) A built in clock/timer.

No. No. No. No. I guess you could use an external antenna
switch, one for vertical, and one for beam. The S-meter would be
good for the beam. A recording jack with constant output would
be excellent. Why don't more radios have this? The SW rig I
have has an "external speaker" jack (mini phone plug) and a
mono 1/4" plug for headphones. No record jack, $%#&^!! I
haven't seen a clock in a scanner since my stepdad's Bearcat
210 several years ago. If it comes with a record jack, I'd like
to see a function where you could connect a plug from the scanner
to the remote control on a cassette recorder. When a specified
channel(s) were active, the recorder would come on. This could
be set with front panel controls. The above mentioned Bearcat
did this, and it was great.

RE: Tennelec scanners

pM> parts difficult to obtain. Radios reputed to be poor
pM> performers. Got my MS-2 and MCP-1 basket cases for free

Wed 01-24-1990 [22:41]
Dunno. I was able to receive the Kansas City area Missouri State
Highway Patrol from southwest Missouri using only the supplied
antenna, and it performed real well when skip was rolling in. The
only disadvantage I found was that when skip _was_ rolling in,
it was a real PITA to program 16 consecutive channels. As you
know, you had to enter that gawd-awful binary code. The
"search" function is a Godsend... All-in-all, a satisfactory
performer. My stepdad's sister has his Tennelec, and I'd like to
get ahold of it, just to keep it on the table to listen to the
local PD, so I could free up my Pro-2003 and Pro-2004. Besides,
the Tennelec's flashing lights were pretty awesome, hi.

601. Kenwood TH-x6AT series, mods

Newsgroup: rec.ham-radio
Date: 1990-01-27 12:28:53 UTC
From: kjh@pollux.usc.edu
Message-ID: <22534@usc.edu>
Source record: 13956
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Kenwood has anounced (advertised) the TH-26AT and the TH-46AT. These look almost identical to the TH-25AT and the TH-45AT. The differences (read improvements) are:

* 21 memories instead of 14
* DTMF squelch system
* 4 number 15 digit autodialer
* frequency step size selectable (5, 10, 12.5, 15, 20 or 25 kHz)
* wider (RX) coverage on 2m model
* time operated or CARRIER OPERATED RESUME on scan

My biggest complaint against the TH-x5AT series was the time operated scan. This is the next closest thing to useless. All the rest seems to be just fluff.

I think that the TH-x6AT series can't be too much different from the TH-x5AT series. I'm not going to go out and buy them to see, but I have strong suspicions that the mods that I previously posted to allow out of band TX/RX and retuning the PLL will still apply. Of course, the mods that I posted for changing the frequency step size are now moot. I would appreciate it if someone would try out my mods on their new TH-x6AT, and report back to the net. If anybody wants a copy of my mods, I can post them again. They are probably also archived in a number of places. 73, and why can't the Japanese get it right the first time? They really messed up with the time operated resume while scanning, and even now the 70cm rig doesn't RX out of band!

In the rare case that original ideas Kenneth J. Hendrickson N8DGN
are found here, I am responsible. 1709 S. Bonnie Brae, LA, CA 90006

602. R7000 on 12 Volts DC

Newsgroup: rec.ham-radio
Date: 1990-01-27 16:07:43 UTC
From: charlie@oakhill.UUCP
Message-ID: <2879@radio.oakhill.UUCP>
Source record: 13957

Attention R7000 owners/hackers:

I was noticing in my R7000 manual that it looks like there is a plug
hidden behind a small panel on the right rear near the AC line cord.
I removed the cover and sure enough there is a MOLEX type of plug with
a shorting jumper in it. It apparently jumpers the +12 volts from the
power supply to the rest of the radio. COULD THIS MEAN that the R7000
can be operated in your automobile from 13.8 VDC?? Looks like it to me.
One might also install a noise filter in the 'space' provided in the radio.
Bob Parnass...have you noticed this about the R7000? Has anyone converted
their R7000 to +12V optional operation? Does anybody see any problems
with this? R7000 in the car would be pretty neat.

-> hefty brass clamps right next to the rods, so this was no problem.

>Pretty wierd. Might be the "solder alone isn't enough" line of reasoning.

The logical consequence of a lightning hit is high current flow, leading to
heat in the joint, leading to melted solder. A good mechanical connection
is necessary.

>--

Yes it is true you should really never solder a ground, like when wiring
a house, you have a eight foot ground rod that is copper, and you have to
pound that thing into the ground with a sledge hammer so it only sticks out
oh about 1 inch or so. Then you need a U clamp and run the wire to that..

A nice eazy way to put in one of these big ground rods is to pick yourself
up a hammer drill A nice BIG one like A Makeda (sp) or A Millwakie (sp)
then put the ground rod on the ground tip to the ground and the hammer drill
in the hammer pos. and start her up it will me done in a matter of seconds..

However there is a safer method (drill safty) you get a piece of meatal like
a drinn bit shor so it does not stick out of the drill when you weld a cup like thing on to
it so the grond rod can go into that, this helps avoid
damaging your drill or getting the rod stuck in it...
enjoy and maybe thiss will help you out for installing the ground rod.

Yes, the R-7000 can be easily modified to operate off +12V. I've been doing that with mine for quite some time, since I have a common 12V power system I use to power the rest of my radios.

Running the R-7000 off an external 12V supply allows you to avoid using the internal AC supply, which gets quite hot with continuous operation.

Phil

So you want a Real Ground (tm)?

The real experts in this sort of thing are the VLF/ELF people. One (suprisingly) good source on the topic is "The Handbook of Solar Flare Monitoring and Propagation Forecasting" by Carl M. Chrenan, published by TAB books. Chernan's recipe for a Real Ground (tm):

1. Dig a hole 18" in diameter down 4'.
2. Drive a 3/4" by 8' copperweld ground rod into the center of the hole, flush with the ground.
3. Fill hole with mix of 2 parts Bentonite, 2 parts (non-setting) Gypsum, and 3 parts rock salt, leaving 6" on top.
4. Place a 3/4" by 4' perforated PVC tube with bottom capped into mixture, flush with ground.
5. Fill in remaining 6" with soil. Place a nice looking cap on the PVC tube.

Now, every month, put 5 gallons of hot water in a bucket, and dissolve as much rock salt as possible into solution. Uncap the PVC tube, and pour in the brine. You now have a Real Ground (tm), whose resistance should be a mere fraction of an ohm.

No, but I converted my FRG8800 to +12 volts DC so I could
use it in Africa when the AC power went off (which was about
every other night).

Someone told me recently that the 8800 now comes with the
conversion already installed?

I worked on a project that used a satellite transmission from CQI. There
were two flavors. The realtime data stream that the brokerages got and
a 15 minute delayed stream that the rest of the world could used.

What restrictions are there on the time delayed version, and what does the
SCA service use?

Yes, to run the R-7000 from 12 VDC, I installed the Icom DC kit.
Although it is advertised as an R-71A accessory, it works equally
well with the R-7000.

I've put the R-7000 in my truck for tasks like locating the source
of power line QRN.

613. SCA - Not as easy as it seems

Newsgroup: rec.ham-radio
Date: 1990-01-28 01:18:10 UTC
From: roskos@IDA.ORG
Message-ID: <1990Jan28.011810.1861@IDA.ORG>
Source record: 13968
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Recently someone forwarded to me a Usenet article, apparently about 5 years old, by John Sangster (W3IK) of MITRE, explaining how to do SCA demodulation. It was a very good article, and made everything very clear; since I'd been intending to try it for a long time, and since I'd gotten a lot of experience with the 565 PLL building the WEFAX demodulator which I described here about a year ago, I decided this weekend to try building an SCA demodulator.

Alas, it is not nearly as easy as it seems, apparently. It was very easy to build the demodulator; there's a diagram for one in Figure 5 of the Signetics 565 data sheet, and I built it on a small perfboard about 1" square so it would fit inside a portable radio. I also bought a $15 FM radio from Radio Shack (their "anywhere radio") for the purpose. (The completed VCO in the demodulator runs at the proper frequency, and the demodulator itself appears to work.)

According to Sangster's article, "the best way to recover the SCA audio is to go in to the FM receiver and tap off at the `top' of the volume control."

I've tried this with three receivers now -- the above-mentioned $15 radio, a Radio Shack DX-400 shortwave radio (with FM), and my full-size FM stereo tuner.

The $15 radio is based on a 1-chip FM receiver -- though not the one in the Radio Shack semiconductor book -- and there are only two pins on the IC that have an AF signal on them. Both of them, when observed with an oscilloscope, are "clean" in the sense that when there is no sound coming out of the speaker, there's no signal present. I think, if I understand how this works, there should be a 67 KHz subcarrier present even when there is no sound, if you have the proper signal.

The results with the DX-400 were more interesting -- I unfortunately don't have the manual for it any more, so I traced the signal around with an oscilloscope and a signal tracer. I found that again, all the AF signals I could find were "clean" in the above sense. But I did find that if I connect my demodulator to a fairly strong signal in the IF, the demodulator would demodulate the (regular) FM program out of it. This makes me wonder if maybe the IF for the DX-400 is around 67 KHz, since that is what the demodulator was tuned for.

I also tried it with my ancient STA-720 stereo receiver. It has two ICs of interest, an LA1231 and an LA3350; the former seems to be the FM demodulator, and the latter the stereo demultiplexer. There was a signal going into pin 2 of the LA3350 that looks more like a composite

audio signal, so I tried using that. But the result is that when the radio is tuned onto a station, I get no signal out of the SCA demodulator; if I detune it slightly, I can hear the station I am tuning away from. (This is true for all stations. I know there is at least one SCA program being broadcast locally, since a local charitable group advertises that they provide free radios to the blind for use in receiving SCA "readings for the blind". I would suspect that in a city of this size (Washington, DC), there would be others as well.)

This is very puzzling, and somewhat discouraging. Has anyone built an SCA demodulator using a 565? What kind of radio did you use as the receiver? Did you have to modify the circuit in the Signetics data sheet? The circuit in the data sheet is fairly simple... there is a high pass filter to filter out the main program signal, then the PLL, then a low pass filter to filter out the noise from the PLL's VCO. I had hoped from reading the above article that it would be simple to just insert the demodulator between the original input to the volume control of a portable radio and the volume control, giving a radio that could receive SCA... but it seems to be more difficult than that.

(The original article talks about using a VLF receiver to receive the SCA by connecting it to the composite audio from an FM station. So I realize that approach is available, but I don't have a VLF receiver, and would rather build a demodulator specifically for the purpose.)

Thanks for the good info, Paul!! I just need a few more details, which
others probably do too.

In article <1990Jan27.211839.4955@Neon.Stanford.EDU> paulf@bodega.stanford.edu.UUCP (Paul
Flaherty) writes:
>So you want a Real Ground (tm)?
[etc.]
>3. Fill hole with mix of 2 parts Bentonite, 2 parts (non-setting) Gypsum, and
> 3 parts rock salt, leaving 6" on top.

I have no idea what Bentonite and Gypsum are (and don't particularly care).
But where can I find them - what type of store?

>4. Place a 3/4" by 4' perforated PVC tube with bottom capped into mixture,
> flush with ground.

I didn't see perforated PVC tubes, only solid ones at a store a while ago.
If I drill my own holes, about how many per foot and about what diameter?
I suspect the idea is a small enough hole to allow the brine to seep out
over the entire length of the tube.

Would that not be governed by which passport you travel under? If you enter
Germany under a visa on a U.S. passport, I would think the German government
would more or less expect you to use the U.S. license. In fact, I'd be
surprised if they didn't insist on it.

Bentonite is a porous clay; gypsum is a type of chalk. Try a gardening or building materials store.

>If I drill my own holes, about how many per foot and about what diameter?

Actually, you could probably use a soaker hose. The main idea is to distribute the brine quickly and evenly.

The answer is most definately yes !. I have used mine mobile
and I know a number of other people who have regularly used theirs mobile.
The only hassle is, that to do it right, you need a little bracket thingy
to hold the molex connector in the hole once you remove the cover plate.
This bracket and a DC power cable with matching molex plug are available from
ICOM (part numbers are listed in the service manual which I unfortunately
have at home where I can't look them up as I post).

Naturally, as with any expensive ham gear not screwed to the car
in the radio hole, the possibility of collecting on your car insurance if you
loose the thing to a thief is somewhat limited unless you carry a special
policy covering radios.

From: JKING
To: AMSAT
CC: PKARN
Subj: Microsat TX Frequencies

Phil, KA9Q is interested in conducting doppler measurements for all of the SPOT mission spacecraft in the interest of sorting out the separating bodies as soon as possible and in deriving the orbital elements for same. In so doing, he asked me for the precise frequencies of the transmitters. It occured that others may also be interested in making these measurements and that these exact frequencies have not yet been distributed.

The following frequencies were taken after the completion and final tuning of the completed transmitter assemblies. The temperatures were taken at 23 deg. C. Note that currently, the transmitters are closer to 0 deg. C. I am searching to see if we have any data that suggests how the frequency of the transmitters changes with temperature.

PACSAT:

Normal PSK TX: 437.02625 MHz

Raised Cosine TX: 437.05130 MHz

S-Band TX: 2401.1428 MHz

DOVE:

FM TX No. 1: 145.82516 MHz

FM TX No. 2: 145.82438 MHz

S-Band TX: 2401.2205 MHz

WEBERSAT:

Normal PSK TX: 437.07510 MHz

Raised Cosine TX: 437.10200 MHz

LUSAT:

Normal PSK TX: 437.15355 MHz

Raised Cosine TX: 437.12580 MHz

I have no data on frequency change with temperature for these transmitters. Perhaps someone else made temperature measurements during thermal vacuum. The log book doesn't help.

Happy Doppler Shift.

73's,
Jan

Subj: sep analysis

I've uploaded to DOCS an analysis of the straight-line distances between each pair of objects associated with the Ariane V35 launch, in the hope that this might help those trying to sort out the various objects. Certainly the close proximity of pairs like 1990 005C and 005E ought to be a clue to their identities.

I also note that object 005B has a mean motion significantly larger than the other seven objects. This leads me to suspect that it's the spent launcher. Object 005A has a mean motion somewhat smaller than the others, and is in the least eccentric orbit; this I suspect is SPOT-2.

Would those posting orbital elements please provide sets for all eight objects (005A thru H) until we are able to positively tell which are NOT the ones we want? NORAD's assignment of object numbers to satellite names is almost certainly in error. Thanks!

Phil

In the hope that this will help someone with the detective problem of sorting through the menagerie of objects from the Ariane V35 launch, here's a computer analysis of the current straight-line distances between each pair of objects. The letters before each pair of results are the objects' international designators (e.g., the first entry is for the pair of objects 1990 005A and 1990 005B). The distances are given for two arbitrary instants 24 hours apart, and are in kilometers. The "V" flag on the end of the line indicates that the objects are visible to each other (the line between them does not intersect the earth.)

The positions of objects B thru G were based on Keplerians with epochs on day 26 read to me over the phone by N4HY; Keplerians for objects A and H had epochs on day 23.8 and were the ones I fetched the other day from TS Kelso's BBS.

This most certainly is correct. In fact, I purchased the 12 volt
kit from Icom. It is the same kit as thier other radios. It comes with a
molex connector and DC pig-tail. I put a cigarette-lighter plug on it
and voila, the R-7000 goes into the car lickity-split. Apparently there
seem to be some confusion as to there being a kit available for the
R7000 when in fact it uses the same as all the rest. Happy listening!

John

621. Keplerian elements

Newsgroup: rec.ham-radio
Date: 1990-01-28 06:26:12 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19501@bellcore.bellcore.com>
Source record: 13976

I haven't seen any Keplerian elements from TS Kelso's BBS lately, so I
logged in directly and pulled over the latest set. Here they are.
Note that the names for the various Ariane V35 objects are almost certainly
wrong (except perhaps for SPOT-2) so don't place too much faith in them.

I've got some later elesets for objects B-G via N4HY that I'll post next.

622. Ariane V35 element sets

Newsgroup: rec.ham-radio
Date: 1990-01-28 06:32:57 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19502@bellcore.bellcore.com>
Source record: 13827

Here's a composite collection of the latest element sets I've been
able to find for the eight objects launched on Ariane V35:

Satellite: 1990 005A
Catalog number: 20436
Epoch time: 90024.87607554
Wed Jan 24 21:01:32.926 1990 UTC
Element set: 8
Inclination: 98.7236 deg
RA of node: 101.3451 deg
Eccentricity: 0.0003445
Arg of perigee: 177.1740 deg
Mean anomaly: 182.9359 deg
Mean motion: 14.26690700 rev/day
Decay rate: -6.32e-06 rev/day^2
Semi major axis: 7178.101 km
Anom period: 100.932879 min
Apogee: 802.480 km
Perigee: 797.534 km
Ref perigee: 4406.91055006
Wed Jan 24 21:51:11.524 1990 UTC

Satellite: 1990 005B
Catalog number: 20437
Epoch time: 90026.68847227
Fri Jan 26 16:31:24.4 1990 UTC
Element set: n4hy1
Inclination: 98.6159 deg
RA of node: 103.1441 deg
Eccentricity: 0.0011923
Arg of perigee: 180.3428 deg
Mean anomaly: 179.7745 deg
Mean motion: 14.30130452 rev/day
Decay rate: 1.252e-05 rev/day^2
Semi major axis: 7166.572 km
Anom period: 100.690115 min
Apogee: 796.972 km
Perigee: 779.883 km

The Complete Answering Machine card is a nice unit. It will even let you address the cards so that up to 4 units can be placed inside 286 or 386 class machines. The software however does limit its use to answering phones only. If anyone gets their hands on some type of source code for the units, I would love to hear from them.

Another idea is looking into AT&T's Voice Power Boards or older models of ther CONVERSANT 1 or 2 systems. We have these systems at Santa Monica College in operation for automated Touch-Tone registration. They are fully programmable using modified C code. I saw some companies selling used gear a while back. I have yet to try and interface the system with the radio gear but the thought has crossed my mind.

This is apt to be nonsense. The place you have to pick it off is between
the output of the FM detector and the Multiplex decoder (if it's stereo)
or before the de-emphasis network/filter (if it's a cheap mono). By the
time you get to the volume control, there's a pretty good chance the
high frequency compenents you're looking for have been wasted.

Forgot to mention:

1) Don't expect many stations to be running SCA - in Philadelphia there were
only 4, one a doctor's info network, one some kind of data, and I don't
remember the other two.

2) Most likely stations are the ones that broadcast easy listening aka
elevator music - often put out similar programming less the adverts.

3) The off-channel tuneing effects you describe aren't surprising, probably
some crude demoulation of the main or stereo sub-carrier.

4) If you can borrow a 0-100KHz audio spectrum analyser, it makes things
a bit easier, since it give a graphic indication of the various carriers
in the multiplexed signal.

One company offers a voice mail attachment for their $2700 repeater controller; it's in the same price range when you fill it up with memory.

Now you can make your repeater not only sound like a pinball machine, but it can now repeat the wisdom of deceased old farts long after they're gone.

Is this the ham radio equivalent of hanging fuzzy dice from your rear-view mirror?

In article <1990Jan27.211839.4955@Neon.Stanford.EDU> paulf@bodega.stanford.edu.UUCP (Paul Flaherty) writes:
]So you want a Real Ground (tm)?
]
]The real experts in this sort of thing are the VLF/ELF people. One
](suprisingly) good source on the topic is "The Handbook of Solar Flare
]Monitoring and Propagation Forecasting" by Carl M. Chrenan, published by
]TAB books. Chernan's recipe for a Real Ground (tm):
]
]1. Dig a hole 18" in diameter down 4'.
]2. Drive a 3/4" by 8' copperweld ground rod into the center of the hole,
] flush with the ground.
]3. Fill hole with mix of 2 parts Bentonite, 2 parts (non-setting) Gypsum, and
] 3 parts rock salt, leaving 6" on top.
]4. Place a 3/4" by 4' perforated PVC tube with bottom capped into mixture,
] flush with ground.
]5. Fill in remaining 6" with soil. Place a nice looking cap on the PVC tube.
]
]Now, every month, put 5 gallons of hot water in a bucket, and dissolve as
]much rock salt as possible into solution. Uncap the PVC tube, and pour in
]the brine. You now have a Real Ground (tm), whose resistance should be a
]mere fraction of an ohm.

There are some problems with this approach:
(1) If you live on a rock, it's hard to drill the hole.
(2) If you live in a dry climate, such as here in Phoenix, the
ground conductivity is so low that even the above approach
will produce only a marginal ground.

There are some other techniques. I learned these from Hartley Gardner,
W1OQ, who knows more about lightning protection than anyone I have met.
He makes his living designing and installing commercial sites on
mountaintops here in AZ. Many of these sites get hit several times
during every storm. Most are built on low conductivity soil or
rock.

Lightning has a lot of high frequencies in it. Thus the same thing
that would work as a ground for a vertical antenna (75 meters or so)
will help.

The technique for poor soil is:

(1) Plant several 8 foot large diameter (1" or so) ground rods
in a 10-20 foot radius around the tower. Use epson
salts or whatever to improve their connection to the ground.

(2) String LARGE, solid copper wire (.5" diameter or bigger)
wire between each ground rod and the tower. Also run these
around between the ground rods around the circumference of
the system.
(3) WELD the copper wire to the rods using a CADWELD (sp?) system.
This is a device that has a mold in the right shape for the
copper wire and the rod. You fill it with a powder containing
copper and some form of thermite, and then light it. When it
is done, you have a seamless, big copper weld surrouding the
junction of the wire and the rod. Of course, if you don't have
a CADWELD, you can use clamps.
(4) Make sure the wires are well bonded to the tower structure (or
whatever you are protecting). If you are protecting a building, run
the same large wire over the top of it in a grid pattern to make
a shield.

If you are on rock, you can achieve pretty good lighting protection
by making a large capacitive hat over the rock. Basically make the
same system I just described, minus the rods, and with more wire and
as large a diameter as you can get away with. The "hat" will soften
the lightning pulse, and also provide enough conductivity to
soak up the current over time.

Any decent design will have filtered out anything above 15 Khz at that point.

> The circuit in the data sheet is fairly simple... there is a
> high pass filter to filter out the main program signal, then the PLL,
> then a low pass filter to filter out the noise from the PLL's VCO.

There can be up to 3 SCA carriers 62, 75, and 92 Khz (off the top of
my head). Your PLL will lock on the strongest of one of these, (or
the 19 Khz stereo pilot tone). What frequency is the VCO at?

> (The original article talks about using a VLF receiver to receive the
> SCA by connecting it to the composite audio from an FM station. So I
> realize that approach is available, but I don't have a VLF receiver, and
> would rather build a demodulator specifically for the purpose.)

I used an old tuner with a ratio detector which had a test point used to
adjust the detector, and connected that to my VLF convertor thru a 270 Kohm
resistor to keep from loading the circuit down. Make sure to tap in before
any low pass filtering before the stereo demultiplexer chip.

How do you electrically connect to this good earth ground? To the ground rod that is 1.5' deep? With copper wire?

Won't the brine corrode the copper wire? Won't the brine corrode the buried ground rod? What is the expected lifetime of this "good" ground?

In a quick tour of the stations I can get, (Puget Sound, the multipath
capitol of the west coast) I found 6 SCA's on 5 stations.
Two elevator music, two data channels, a spanish program, and news for the
blind. I probably missed some because even a small amount of multipath
will bury the subcarriers in noise. And nonlinearity in your main
FM demodulator will splatter the main audio all over.

> no new equipment for it and the used 6m rigs go for a song.

I am not ready to do CW/SSB type DXing on the VHF/UHF bands, so all that I do presently is FM. 6 meters has a problem. There are four radios I know of currently made for 6 meters and support synthesized tuning. One of these is the Icom IC-575 base station unit. Another is the Icom IC-59X add on for the IC-900/901 multiband and expensive mobile units. Another is a Yaesu unit whose model number slips my mind. It is a SSB/FM unit that looks like a mobile and that they are trying to convince you is portable. The last is the Yaeso FT-736 multi-band base unit that needs the 6 meter band module to get on 6.

Most 6 meter gear in use seems to be older crystal controlled units. With no 6 meter repeaters around here, I have no need for crystal control. I need synthesized tuning, but there simply is no suitable equipment on the market yet.

Japan is not supplying the US with what the US needs, but rather is only trying to keep a higher economy of scale for equipment thought out primarily for the Japanese market. The American sales reps are not making much effort to communicate to Japan about the needs here; they are just making excuses.

> On another note, I see that the Novices can now use the 1.25m and 23cm
> bands. How active are these bands? Can a Novice find traffic on these
> bands in rural areas or are they urban only where 2m is "full"?

220 and 440 start getting used before 2m is "full". 440 more popular for this in part because of the surplus availability, and in part because of the historic and present lack of new 220 equipment. What happens just before the band gets full, is the lids get on the 2m. The flight to 220 and 440 first begins by some to escape the lids. It seems a greater proportion of 440 repeaters are PL'd and private, for such reasons perhaps.

> Just another bubbling ham wondering about what it will be like once he gets
> his ticket.

Well, since you are probably studying hard for your ticket, if not already waiting for it to arrive and studying on the upgrade, it won't be long before you can tell us what the bands are really like.

634. SCA - not as easy as it seems

Newsgroup: rec.ham-radio
Date: 1990-01-29 13:24:46 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <9001291324.AB00031@adam.DG.COM>
Source record: 13839

CEO summary:
Eric Rosko writes that he's having problems demodulating SCA broadcasts. I've built the same NE565 demodulator from the same Signetics application note and have hooked it up to both a Ford car radio (AM/FM, poked around the IF area until I found something with audio on it) and a early 1970s stereo tuner which had a "quadraphonic decoder" jack on the back. Both worked fine...I found that there were all kinds of SCA transmissions but the universal feature they all had was a fairly high S/N ratio. The carriers are transmitted at very low modulation levels compared to the program audio (someone will enlighten us with the exact percentage, no doubt). The point is that maybe you need more signal level, or, ideally, a high pass filter with a cutoff around 50Khz (since 38Khz is the L-R stereo subcarrier which you don't want, and 67KHz, I believe, is the first SCA carrier). Don't forget some gain before the filter.
Good luck,
Peter Simpson, KA1AXY
Data General Corp

Well, here in Western NY, conditions also REALLY STANK!!! We basicaly had nothing in the way of enhancements until late Sunday, when we had a weak aurora. Like Mike W9IP/2 reported, I think nearly everyone had "taken their marbles and gone home" by the time the Au showed up. I operated with a multi- WB3JSU/2 in FN03, west of Rochester, NY, on all bands through 10GHz. Our breakdown is as follows:

6m- 128 x 32
2m 329 x 50
220 70 x 23
432 78 x 24
902 11 x 8 (really low- the ice really screwed up the microwaves)
1.2 18 x 11 (same as above)
2.3+ 12 x 7 (same as above)

We did work N0KNN (EN42) and K5CM (EM25) on 6m scatter Sunday morning. It was disappointing because everyone worked so hard- we never quit, but things were really socked in.

My home station was operated by KE2DI using his call and he managed about 21K in spite of melting the water hoses on the 1296 final and pouring water all over it and the 2m and 70cm amps.

Some of the scores I have heard are:

WC2K (FM29 multi)- 402K
VE3ASO (FN25) - 87K
W2CNS (FN13) - 74K
N2WK (FN13) - 114K- All Right Wayne!!!

And our own (WB3JSU/2) (FN03 multi)- 150K

That's all I know- let's hear some more numbers from the other big single and multi-op stations.

73 Dave KD5RO/2

What I have always used to improve ground conductivity is Copper
Sulphate. I use it in preference to common salt for two reasons.
First common salt (Sodium Chloride) is pretty corrosive. The
second reason is that high saline levels in soil make it barren.
Large bare spots in the lawn cause more grief with the neighbours
than large pieces of aluminium on the roof.

Copper sulphate is available from many gardening and farming
stores. It is used in agriculture to make "Bordeaux mixture",
this is a mixture of copper sulphate and lime, it is used as a
fungicide. Copper sulphate is also often used as an algicide.
Bought as industrial grade, copper sulphate is quite cheap.
Don't try to by it from a lab supply house, if your heart can
stand the price, your wallet won't. If you can't get copper
sulphate, you can in a pinch use ferrous sulphate. Ferrous
sulphate is also available from farm and garden stores.

Most ground seems quite conductive as long as it is damp. That
seems to be the key.

Even though AEA has made no information public about the rumored "DSP 232"...
I was wondering if this is indeed the proper time to sell my beloved PK232
at what is still close to it's purchase value. With the 6 microsats
successfully launched - the future is here once again - and if the new TNC's
can indeed do everything that the '232 did + more...
I think it's worth it. Guess we'll have to wait 'till Dayton Hamvention to see.

If any of you have any opinions on the subject,
I'd appreciate hearing from you.

73,
4X1DA @4XNET

It seems to me that all this gives you is a good earth ground
CONNECTION, not neccessarily a good earth GROUND. The Ground surrounding
the connection is not effected, and depends on it's own conductivity,
which, unless you live near water, is generally poor.

markz@ssc.UUCP (Mark Zenier) writes:

>There can be up to 3 SCA carriers 62, 75, and 92 Khz (off the top of
>my head). Your PLL will lock on the strongest of one of these, (or
>the 19 Khz stereo pilot tone). What frequency is the VCO at?

I tuned the VCO's free-running frequency to 67 KHz. I also tried varying it throughout its range (which is very large) while tuned to a station.

Since posting the original message, I have received several helpful replies, though I don't have the demodulator working yet:

a) One person had a commercially-made SCA demodulator that was intended to go in the particular radio I had (a Radio Shack DX-400, which is a predecessor to the current DX-440, and was made by Uniden). His instructions told where to connect the demodulator, so I connected mine to that same point.

b) Someone else (who has always known exactly what he was talking about in the past) wrote to say he'd tried the circuit from the Signetics data sheet and couldn't get it to work either.

I'll summarize the responses in more detail after I figure out what's wrong with the demodulator.

My current belief is that possibly there is a problem with the circuit that appears in the Signetics data sheet. (Interestingly, this circuit and the text describing it is copied almost verbatim in a book on communications published by Prentice-Hall which I have at home, without giving acknowledgement to the source.) One thing I find is that almost nothing gets through the filter at the input to the VCO; there is a very weak signal present, but noise from the VCO (which is probably around 10 millivolts itself) present at the input pin of the 565 is stronger than what gets through the filter. I am thinking maybe the filter doesn't work right. Ironically, this same thing happened when I built the WEFAX demodulator that I wrote about last year... the capacitor values which appeared in the Signetics data sheet for the FSK demodulator were incorrect, and by trial-and-error I found other values that worked correctly.

[This is a weakness in my background, I'm afraid. All the textbooks I have show filters in terms of LC circuits, whereas all the filters that appear in these practical circuits are RC filters. I don't know how to calculate the cutoff frequency for the filter in the data sheet, as a result. I don't have the data sheet here, but if I remember right the filter is as follows:

```
signal input -----510pf--+--510pf--+--PLL input
| |
| |-- bias voltage (+) from voltage divider
4.7K
|
===
-
.
```

I'll have to check that and make sure, but I believe that's it.]

643. Latest Microsat keplerians

Newsgroup: rec.ham-radio
Date: 1990-01-29 17:02:53 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19503@bellcore.bellcore.com>
Source record: 13865

Here's a composite collection of the latest element sets I could find for the eight objects associated with the Ariane V35 launch. The satellite names are of the form 5a, 5b, 5c, etc., corresponding to objects 1990 005A, 1990 005B, etc.

Based on doppler measurements over the weekend plus other factors, I currently believe that object A is SPOT-2, B is the Ariane third stage, C is AO-16 (Pacsat), D is UO-14 (UoSAT-D), E is DO-17 (Dove), F is WO-18 (Webersat), G is LO-19 (LUSAT) and H is UO-15 (UoSAT-E).

These are of course subject to change as we get new element sets; the differences between these sets can be subtle, and the corrections can be large, especially in the first week or two after launch. I'm especially suspicious of sets with negative decay rates.

From: RSOIFER
To: bmcgwier, pkarn
Subj: More observations, tentative id proposal

Based on my last phone conversation with Phil, we tentatively think
that C is PACSAT, D is UOSAT 3 (UO14), F is WEBERSAT and H is UOSAT 4
(UO15). That left E and G to be assigned between DOVE and LUSAT.
So, on this last (1800) pass, I decided to track DOVE on the 2m rx
and LUSAT on the 437 MHz rx. LUSAT clearly led DOVE; TCA for LUSAT
was 17:57:55 while TCA for DOVE was 17:59:30. AOS and LOS times
also led for LUSAT by a minute or more. Hence, I believe that
E is DOVE and G is LUSAT. That completes my tentative object
identification, until someone comes up with a conflicting
observation. What say? 73, Ray

From: PKARN
To: amsat
Subj: More observations, more confidence

I just saw Ray's report of a good TCA measurement for UO-D that he says
exactly matched object D. I had already tentatively concluded the same
thing, so I guess I can now up my confidence in that ID from "moderate"
to "very high". By process of elimination, that also strengthens my
confidence in E being Dove and H being UoSAT-E.

Jan, could you redo your velocity analysis with these identifications
and see if there is much change? Thanks.

One thing that would provide very good information for object
identification would be the precise time of a sunrise or sunset for
each object, since they occur in just a few seconds at that altitude.
Unfortunately the present geometry of the orbit and terminator makes it
difficult to find a ground station that can observe this in real time,
so I've asked N4HY about the possibility of uploading routines to do
it. He says it can be done in a couple of days.

Surrey: could you guys do the same thing for UO-D (and hopefully UO-E)?
Thanks!

Phil

Subj: Data needed for Weber

For any stations that stored data from WEBER during the pass visible
from the East coast Saturday morning local. I need everying that
came out starting at :

PHT: uptime is 044/03:23:07. Time is Sat Jan 27 16:53:51 1990

for the next 40 seconds.

In that range should be a message like this:
WEBER-1>MEM-0: <text>

I need to know if there was such a message, and what the contents were.

Thanks,
Harold

Subj: Orbit terminator observation.

Phil,
Unless I'm mistaken, we see the orbit terminator here, and could record
some observations. Expect a bit more UoSAT news on Monday, as we look
through all the tracking information you've generated this weekend. Our
buddies with the radar can confirm that the leading object is the launcher,
and we know from their orbit manoeuvers that SPOT is the trailing object.

Subj: UoSAT-OSCAR-14/15 REPORT #4

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #004
1846 UTC 28 January 1990

** UoSAT-OSCAR-14 **

The FORTH Diary software is in operation on UO-14, as programmers MS Hodgart
and MLJ Meerman (G0/PA3BHF) ground-test new attitude-determination and control
software prior to re-loading the OBC.

The standard UoSAT ASCII whole-orbit data (WOD) format has been added to the
DIARY's downlink schedule, and new WOD surveys have been conducted daily.
Stations with UoSAT-2 decoders and WOD collection software should be able to
decode these surveys without difficulty. The surveys which have been
transmitted in ASCII so far are a survey of the magnetometer channels (22, 23
and 24 starting at 21:54 on 26 January), and a survey of the PACSAT
Communications Experiment 80C186 CPU temperature and current consumption
(channels 5 and 44, starting 11:45 on 27 January). The very beginning of the

PCE survey clearly shows the 10-degree increase in CPU temperature which occurs when the 80C186 is turned on.

UO-14 analog telemetry channel assignments and equations are as follows:

Channel Name Equation

** UoSAT-OSCAR-15 **

We still have heard nothing from UO-15 since 22 January. Tracking stations and amateur listeners have determined that the object "out ahead" of the Microsat cluster is not UO-15, but the spent Ariane third stage. The object trailing the pack is SPOT-2, which has been raised to a slightly higher orbit and so has lower mean motion than the other satellites.

Accurate reports of UoSAT-OSCAR-15 reception after 2330 UTC on 22 January are desperately needed. The nominal downlink frequency is 435.120 MHz, and transmissions are at 1200 bits/second AFSK-FM.

Jeff,

Now that you mention it, you're right; you can see sunrise a couple of minutes before the end of your first evening pass and almost immediately before the end of your second evening pass. Your morning passes are all in full sunlight. I'm very interested in seeing your data. Are you listening to any of the Microsats, or do you have your hands full with the UoSATs?

I hadn't actually run any terminator visibility calculations until now, thinking that we needed stations well into the arctic or antarctic, but I guess the UK qualifies! I do envy you for all your extra passes, though. Perhaps N4HY and NK6K ought to take a DXpedition to the South Pole, all this microsat software loading would go faster. :-)

Any figures on the separation velocities? I'm trying to figure out why UO-14 and UO-15 are so far apart, if in fact UO-14 is 1990 005D and UO-15 is 1990 005H.

Hello again Ray.

Doppler observations taken here tonight cause me to disagree somewhat with the conclusions that have been presented. On two sucessive passes tonight, I took readings on Pacsat and Weber respectively. Readings were taken at 30 sec intervals and matched against tracking data at 6 sec intervals. I believe that there is a VERY tight fit for Pacsat to be D and Weber to be E. My data would not support the theory that Pacsat is C--off by about 1:20. In addition, previous observations here indicate that Lusat appears to be G. The doppler data is available in Quatro Pro form if any one is interested.(By the way--Q-Pro makes for a really nice way to record and graph the data--the curves look like a textbook example!)

I feel quite certain about Pacsat/Weber/Lusat, everyone seems to agree that A is spot, and I suspect that C is UO14. Elimination suggests then that Dove is F.

So, for my two cents worth----

A-Spot
B-? launcher or UO15
C-UO14
D-Pacsat
E-Weber
F-Dove
G-Lusat
H-? launcher or UO15

I expect to receive new elsets early in the am from Max and will forward along to all--unless Surrey has allready posted them. The email gets to Surrey before me and they go right to tmail whereas I have to deal with the email delays across the "pond". It's unfortunate that RGO is no longer on tmail.

Ed, at this point I believe that all of our observations are limited by the accuracy of the elsets with which we are working, which in some cases are five or six days old (specifically A and H). I won't be satisfied that we have the objects identified properly until our choices hold up over several successive sets of elements. As you receive COMPLETE sets of 8 objects, pse post them so we

can get to work. Tnx & 73, Ray

From: JKING
To: AMSAT
CC: PKARN
Subj: Microsat TX Frequencies

Phil, KA9Q is interested in conducting doppler measurements for all of the SPOT mission spacecraft in the interest of sorting out the separating bodies as soon as possible and in deriving the orbital elements for same. In so doing, he asked me for the precise frequencies of the transmitters. It occured that others may also be interested in making these measurements and that these exact frequencies have not yet been distributed.

The following frequencies were taken after the completion and final tuning of the completed transmitter assemblies. The temperatures were taken at 23 deg. C. Note that currently, the transmitters are closer to 0 deg. C. I am searching to see if we have any data that suggests how the frequency of the transmitters changes with temperature.

PACSAT:

Normal PSK TX: 437.02625 MHz

Raised Cosine TX: 437.05130 MHz

S-Band TX: 2401.1428 MHz

DOVE:

FM TX No. 1: 145.82516 MHz

FM TX No. 2: 145.82438 MHz

S-Band TX: 2401.2205 MHz

WEBERSAT:

Normal PSK TX: 437.07510 MHz

Raised Cosine TX: 437.10200 MHz

LUSAT:

Normal PSK TX: 437.15355 MHz

Raised Cosine TX: 437.12580 MHz

I have no data on frequency change with temperature for these transmitters. Perhaps someone else made temperature measurements during thermal vacuum. The log book doesn't help.

Happy Doppler Shift.

73's,
Jan

Subj: sep analysis

I've uploaded to DOCS an analysis of the straight-line distances between each pair of objects associated with the Ariane V35 launch, in the hope that this might help those trying to sort out the various objects. Certainly the close proximity of pairs like 1990 005C and 005E ought to be a clue to their identities.

I also note that object 005B has a mean motion significantly larger than the other seven objects. This leads me to suspect that it's the spent launcher. Object 005A has a mean motion somewhat smaller than the others, and is in the least eccentric orbit; this I suspect is SPOT-2.

Would those posting orbital elements please provide sets for all eight objects (005A thru H) until we are able to positively tell which are NOT the ones we want? NORAD's assignment of object numbers to satellite names is almost certainly in error. Thanks!

Phil

In the hope that this will help someone with the detective problem of sorting through the menagerie of objects from the Ariane V35 launch, here's a computer analysis of the current straight-line distances between each pair of objects. The letters before each pair of results are the objects' international designators (e.g., the first entry is for the pair of objects 1990 005A and 1990 005B). The distances are given for two arbitrary instants 24 hours apart, and are in kilometers. The "V" flag on the end of the line indicates that the objects are visible to each other (the line between them does not intersect the earth.)

The positions of objects B thru G were based on Keplerians with epochs on day 26 read to me over the phone by N4HY; Keplerians for objects A and H had epochs on day 23.8 and were the ones I fetched the other day from TS Kelso's BBS.

Does anyone have a list of cordless telephone "channels"?

I have a UNIDEN pulse dialer with a "CH19A" sticker on it.
I doubt I'll find much use for this other than as a phone, but I'd be
interested in listening to it with other gear.

Thanks!

My 7850 is out again. (something flakey in the PA when it takes
a spike from the choke I installed ... but anyway) While I've got it
open, does anyone know of some neat tricks I can do with it?, like
expanding coverage past the 143.900 to 148.995 range it has currently.

Does anyone have mods to expand frequency coverage on the Realistic
Pro32 scanner?
Also, would like a fix for the 2 following items.

1. I seem to be getting an annoying HISS from the speaker (and also
from earphones and headphones) at all times.

2. When the volume is cranked way up , I only get a loud roar from the
speaker when receiving nearby stations.

E-MAIL to : JOHN@UWOVAX.UWO.CA
or post in this news item. TQVM

652. New Uniden MR-8100 Scanner Info

Newsgroup: rec.ham-radio
Date: 1990-01-29 19:48:01 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9001300805.AA16685@ucbvax.Berkeley.EDU>
Source record: 13854

I just received in today's mail some literature from Page-Com (a professional-radio distributor) on a new scanner which they described as "intended exclusively for use by public service organizations." Of course, if it isn't meant for us ordinary people, we immediately want one, right? :-) Well, maybe and maybe not... By the way, this is very briefly mentioned on page 7 of the Feb 90 RCMA Newsletter; however, they were working from only a magazine ad. What I have is a full-page spec sheet.

Here's the info, copied exactly [sloppy capitalization & punctuation, too] from the spec sheet:

UNIDEN PUBLIC SAFETY RADIO RECEIVER MR 8100

The product is a high performance scanning radio receiver intended exclusively for use by public service organizations. Its' rugged mechanical design will withstand extreme environments expected in mobile and emergency applications. Oversized controls and displays reduce likelihood of operator error. Frequency coverage includes all public service and federal bands in the range 29 to 956 MHz (includes VHF air band). Capable of scanning nearly 100 channels per second, more channels can be included in the scan without missing information on any one channel. Rather than showing a frequency when a signal is present, English labels identify each channel. The unit is designed for convenient mounting and effective use in all types of mobile applications.

[Illustration: shows a rounded-edged upright device vaguely similar to a laptop computer, except with a single strip of large LCD characters across the top, with some red legends and LEDs below them for a display, two large round knobs marked "VOL" and "SQ" on the lower left, two smaller round knobs in the center marked "CONT" and "DIM", a row of square buttons across the middle numbered 1 thru 9 and 0 (each one under an LED), and 9 more buttons in a 3 X 3 arrangement on the lower right, marked HLD, SCN, "." (that key is round; the others are rectangular), MAN, SPD, L/O, PRI, PRG, and ENT. A mounting bracket holds the unit from underneath, like it was made to mount on top of a dash. A separate model SP1 speaker, with its own mounting bracket, sits next to the scanner.]

[The Page-Com price for this toy is $499.95, by the by.]

FEATURES SUMMARY

Memory
100 channels with English labels; 10 banks

Band coverage channel
All public service and air bands, 29-956 MHz, proper channel spacing for all bands [Hmmm... See chart below; don't think this includes cellular]

Scan Speeds
selected from keyboard normal: 32 ch/sec super: 93 ch/sec
*actual speed depends on how channels are programmed

Supervisory Programming
Control of field programming options via supervisors PC system; full programmability of frequencies, labels, field accessibility to cellular telephone band and priority channel. [I wonder if "field accessibility" means diode clipping or something less extreme?]

Field Programmable
all frequencies field programmable except as restricted by supervisory pre-program

Display
Latest technology, backlighted dot matrix display; 20 alpha-numeric characters, 0.35 inch high

Keyboard
backlighted, widely spaced, rubber keys; 8 functions, ten numbers and decimal point

Scan delay
Automatic, 2 second following transmission

Operating modes
SCAN, MANUAL, PRIORITY, direct channel access, PROGRAM

Rotary controls
Large knobs for volume, squelch. Also backlight dim control. Separate ON/OFF switch

ON/OFF switch
Rocker switch on side of cabinet

Audio
External 6 Watt speaker [wonder if that means the audio amp is only in the external speaker and there isn't any in the scanner? See specs.]

Antenna
Single, 50 Ohn [sic], BNC antenna port serves all bands

Sensitivity
Typically, less than 1 UV [sic] for 12 dB SINAD

Input power
Nominal 10-14 Volt mobile supply, 0.8 Amps max

Operating temperature
-20 to 60{degree symbol}C

DETAILED DESCRIPTION & SPECIFICATIONS

KEYBOARD FEATURES

SCAN Selects SCAN mode while in any other mode or resumes scan on next channel if signal is present on present channel.

CH/HOLD Used to selct HOLD mode while scanning, or, when in HOLD mode, to advance to next channel in scan sequence.

MANUAL Evokes direct channel access mode. User is prompted to enter bank and channel numbers.

LOCKOUT In MANUAL mode, LOCKOUT key alternately includes and removes the present channel from the scan sequence. An indicator is provided to show LOCKOUT status.

PROGRAM Key alternately selcts and deselects PROGRAM mode. PROGRAM mode is used to enter frequencies into memory. User is prompted throughout the programming process. Field programming may be limited or eliminated according to results of pre-programming by the supervisory (PC) system.

ENTER Terminates the programming process by storing the entered frequency into the present channel memory.

NUMBERS Ten number keys and a decimal point are provided to selct channels in manual mode and to enter frequencies in program mode. In SCAN mode, number keys select/deselect banks for the scan sequence.

PRIORITY Alternately selects/deselects PRIORITY mode. Priority mode performs a scan of a single selected channel regardless of scanner operating mode. In PROGRAMMING mode, the key selects/deselects the current channel to be the priority channel.

SPEED Alternately selects between fast or normal scan speeds.

OTHER CONTROLS

ON/OFF Rocker switch on side of case, independent of volume control and more secure.

VOLUME Large volume control without an ON/OFF switch eliminates need to adjust volume at each turn-on.

SQUELCH Large squelch control easily sets receiver sensitivity threshold.

DIM Dim control adjusts intensity of LED indicators and backlighting for the LCD display and keyboard.

LCD Contrast /viewing angle adjustment. [I think this means you can tilt the unit in the bracket...]

RECEIVER SPECIFICATION

Band coverage (MHz) Frequency Spacing (kHz) Sensitivity (uV, 12 db SINAD)
29-29.7 MHz 5 kHz 0.4 uV

End of specs

Note that there is NO info given on this business about "supervisory programming" from a PC. No mention of any special input jacks for the PC to link to the scanner, no mention of the costs or capabilities of the software to run on this cited PC, no specs for the PC itself, etc. Thus this is quite incomplete, until the data for that vital part of the system is provided. Interestingly, Page-Com's cover letter makes no mention of the availability of that, though they claim the scanners are in stock and can be shipped immediately.

Also note that the opening blurb is a direct lie. It claims the unit covers "all public-service and federal bands in the range 20-956 MHz" but it does NOT include the [federal] military aero band, and the bit of federal frequencies in the 70 MHz range (between VHF TV channels 4 & 5).

Feel free to send copies of this to club publications, etc., in order to get the info distributed ASAP. What I wrote here is ALL the info I have; if you want more, call Page-Com or Uniden.

Regards, Will Martin

Yes, it does run on 12VDC. I simply bought ICOM's DC cord for it.
About $8, I believe... :-)

654. G5RV or R4 on 160m ???

Newsgroup: rec.ham-radio
Date: 1990-01-29 21:33:00 UTC
From: menton%v5130c.decnet@CCF3.NRL.NAVY.MIL

Source record: 13856

If all goes well, I'll have a Cushcraft R4 1/2 wave vertical and a low-band horizontal wire antenna installed in the near future. My initial thought for the wire antenna was a G5RV, which, at my friendly ham radio dealer (EEB), includes a baluuuuuuun (baloooooon ??) (you know - a balun!). Question: at the shack, both of these are fed via coax. Do I have any possibility of loading either of these antennae on 160m, by using the old trick of tying the center conductor to the shield and feeding as a long wire? I've done this in the past, but there were no loading or tuning circuits in the antenna as there is with both of the above.

In Pittsburgh, a city of tunnels, there is a wire running down the
Liberty Tubes, and the antenna works well! But, there's none running
through the Fort Pitt Tunnels or the Squirell Hill Tunnels and all you
get is static.

That's the purpose of the brine recharging. The salt leeches into several
cubic meters of surrounding soil, and together with the added moisture,
increases conductivity. The author suggested that this method gives
fractional ohm grounds, even for arid climates.

Also, since the brine is discharged four feet below the surface, it shouldn't
affect plant growth with short roots (like grass). However, I don't know
that from experience, and that's really the only way you'll find out.

I used to work for a Japanase IC manufacturer and am relatively familiar with the process involved in getting a new product through the "system" to the market. Some items you have to take into account are:

1. If you miss your production run date you may not be in the queue again for quite a while. (If you actually cause line down time you may also be out of a job.) Your chances of getting into the queue again soon depend on profitability of product, delivery contracts, line rehab., etc.

2. The profitability of an upgrade such as this is probably nowhere near a new, whole product. If you were responsible for the bottom line which would you produce?

3. The upgrade product may not even be behind schedule. The person you talked to may have no contact with the true engineering group(s) and may be misinformed. How often do the salesbozos you deal with ever really get the story right? (Or at least repeat the story correctly?)

In the final analysis, I have found Japanese production techniques/facilities to be very efficient; significantly moreso than US equivalents. As a result I would be more likely to believe that you were misled than to believe production of the display upgrade to have slipped for anything other than financial reasons.

Of course, this is all IMHO.

From: rps@dtseng.UUCP
Message-ID: <7245@dtseng.UUCP>
Source record: 13858

First a few of questions:

1. Does this sucker have a cross-band repeater type mode? If so,
anyone know how to turn it on and off?

2. Can the VHF receiver be pulled down into the aircraft band like
the 2SAT? If so, what is the mod?

3. Anyone have the service manual for this one yet?

One point of info. An undocumented "function".

If you depress the LIGHT and D buttons while turn on the power the
HT goes through some type of diagnostic. (You also get to see all
the LCD masking this way. Do I see a 440/1.2 HT coming up?...

Isn't CuSO4 toxic to fish? I think I recall that is what they use to kill off all the old fish when they have to restock a lake due to there being an overpopulation of the "wrong" kind of fish.

If so, it would be a good idea not to use it if you live near a lake or a stream feeding into a lake.

What about conventional fertilizer? It seems as if what you need is just a good supply of free ions in the water around the ground. But it seems as if just increasing the surface area of your ground conductor would be the best approach (e.g., burying a metal grid as others have suggested) rather than trying to lower the resistance of a small area around a ground stake, since anything you put into the ground that's water soluble will wash away over time, especially if you have really porous soil, and will tend to go into and contaminate the groundwater. Even fertilizer has this problem since it washes into the surface streams eventually and fertilizes the aquatic plants, causing a lot of algal growth if nothing else.

Well, I finally got around to tracing the problems with connections from IBM/CMS machines and it turns out there was a bug in *my* code. And I've been blaming IBM! Anyway, those of you running under CMS should now have no problem connecting now.

For those not familiar with the server (there are a few of you left), you can access it if your site is on the Internet by connecting to socket number 2000 on the host marvin.cs.buffalo.edu (128.205.32.4). This is probably done with the following command:

telnet 128.205.32.4 2000

It really depends on your operating system, though. If this doesn't work, I'd suggest contacting your system administrator for advice.

gr>(shuttle, air-to-ground, satellite, etc.). I was just wondering where
gr>one would have to look to get these frequencies (i.e. frequency

Sun 01-28-1990 [21:27]
Boy, you don't ask for much, hi! Here it is. It may be in a couple
of messages, as PCBoard has a 99-line limit.

The space shuttle transmits on three frequency bands, UHF, S-Band, and
Ku-Band. The UHF frequencies are simple AM voice and very easy to copy.
These frequencies are used for launch and landing operations, EVA comms,
(i.e. from the spacesuits back and forth to the shuttle), and as an
additional voice downlink when other channels are in use or the current
ground station has no S-Band capability. The frequncies in use are:

296.8 MHz - air to ground, or orbiter to suit
259.7 MHz - air to ground, or suit to orbiter
279.0 MHz - suit to orbiter or suit to suit
243.0 MHz - standard Mil aircraft emergency freq.

The S-Band system is one of the primary orbiter downlink bands. The
voice channels are digital slope delta modulation and are mux'ed in
with the rest of the orbiter telemetry, very difficult to copy. Much
of the downlink TV is on S-Band also but it is wideband FM and should
be easily copyable. The frequencies are:

2287.5 MHz - primary digital downlink
2250.0 MHz - wideband FM with either main engine analog
telemetry during launch, or TV during orbit
operations.

The Ku-Band system is used in conjunction with the tracking and data
relay satellites and is used much more heavily in Spacelab flights than
in others. The data is *very* high rate digital (50 Mbits/sec range) and
therefore essentially impossible for you to demodulate and decommutate
in your basement. Nevertheless the shuttle transmits on 15.003GHz. You
should also note however that these transmissions are directed toward
the TDRS satellite with a high gain antenna and would therefore not be
copyable on the ground. The UHF frequencies are fun to listen to but
are not heavily used except during EVA's. You will almost always hear
some activity on them however sometime during a mission but you just
have to be patient.

I don't know how they'd stop you! The only caveat I'm aware of is the one about playing the "elevator music" in a business without subscribing to the service. My feeling is, if it's unscrambled, and it's passing through my body, then I have no guilt about listening to it. If it's scrambled, and isn't illegal to have descramblers, maybe I'll listen to it. Illegal scramblers? Won't touch them. There's a whole bunch of stuff in the ECPA relating to seizure of equipment and such, but I believe it's basically a toothless law. It will probably be used much as "another nail in the coffin" type of thing. If a bad guy is already under indictment for something, they can add the ECPA onto the charges.

gr>etc. I know someone who is interested in buying a PRO-2004/2005 and
gr>would like more info on these mods.

Mon 01-29-1990 [07:38]
"Someone who is interested"??? Heh heh heh. Yeah, I don't listen to
the CMT band, either. That ECPA has got me just _petrified_, hi. :-)
I got these off a bulletin board.

ZDDDDDDDDDDDDDDDDDDDDDDDDDDD?
3 Modifications for the 2005 3
@DDDDDDDDDDDDDDDDDDDDDDDDDDDY
There is a socket that is not marked so it will be referred to as D501.

D501 and D503 removed : Scan rate of 6/12 cps
D501 only installed : Scan rate of 7/14 cps
*D503 only installed : Scan rate of 8/16 cps
D501 and D503 installed : Scan rate of 10/20 cps (horray!)
*D502 installed : Disable 823.95-850.95 MHz and
868.95-895.95 MHz
D502 removed : Full coverage from 760-1300 MHz
D504 installed : Normal spacing for all bands.
*D504 removed : Enable 30 kHz spacing in areas
restored by D502 removal

* = Stock US model configuration

ZDDDDDDDDDDDDDDDDDDDDDDDDDDD?
3 Modifications for the 2004 3
@DDDDDDDDDDDDDDDDDDDDDDDDDDDY

1. Remove diode from "513" to get excluded 800 MHz freqs.
2. Install a 1N914 diode in "514" to increase scan rate to 10/20
channels-per-second.
3. Install a 1N914 diode in "510" to get the extra 100 channels.
4. Remove diode from "D-44" to restore missing frequencies in th
806 to 960MHz band.
5. Remove diode from "D-45" to restore coverage from 68 to 88MHz.

In step 5 above, I have no idea what this is for. My 2004 came
from the store already scanning this range, and this was the first
I had ever heard of it. The same goes for step 4. When I removed
D513 (as in step 1), I got those freqs back. Perhaps the user who
originally posted these had a radio from a different production
run. All I can "vouch" for is steps 1, 2, and 3.

kp>Also, what kind of antenna will be most suitable for reception
kp>of very low frequency bands (< 100Kc). I have been experimenting
kp>with a long wire of about 30 meters length, without much succes.

Sun 01-28-1990 [21:13]
A longwire of about 30 meters in length is ideal for the 30-meter band,
grin. Actually, it's probably pretty good for 540 kHz to 30 MHz or
so. For longwave, the picture changes entirely. Check some recent
issues of Popular Electronics and 73 for longwave receivers and
their antennas, or write the Longwave Club of America, 45 Wildflower Road,
Levittown, PA 19057. In addition, there's a new BBS which is dedicated
to Longwave - the Long Wave DataBase System - it can be reached at
703-528-7753. It is PC Pursuitable, via the DCWAS pathway.

670. A message counter for you PK232

Newsgroup: rec.ham-radio
Date: 1990-01-30 11:29:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9001310802.AA10218@ucbvax.Berkeley.EDU>
Source record: 13739

Hello all you PK-232 fans out there...

I've added a LED display message counter to the PK-232's front panel.
It lets me know how many people connected to me since the last reset.
This allows me to leave the TNC and xcvr on without having to leave
the computer on constantly. When I come home, if I see any number
greater than "0", I know to turn on the computer and read the message
or messages friends have left for me. The principle is similar to a
telephone answering machine.
The 7 segment display sits nicely in what was once the space between
the ON-OFF switch and the logo in the upper right hand corner.

This is the way it works...

First...
Before you leave for work in the morning...
Designate MBX to be a call no one will ever connect to (E.G. 1G6XX).
This way, only info received after someone connected to you will be
stored in the '232's buffer.

Your '232 will only store data to it's buffer when someone connects to you.

Your CTEXT message should tell the station to leave a message if you fail
to respond directly within one minute (or something to this affect).

The circuit is quite simple. I used a 74LS90 decade counter and a 74LS47
decoder/driver into a 7 segment LED. 5V is taken from the PK232's regulator.

The actual schematic can be taken out of Radio Shack's "Engineer's Mini-
Notebook" series. Digital Logic Circuits - pg.26. (2 Digit BCD Counter).
I used only half the circuit. The input is connected to to CON LED and
the circuit counts up upon the station disconnecting.

Enjoy...

Yes, the Southwest has very poorly-conductive "ground."
Years ago, I was in northern New Mexico. A night-time
storm pulled the 220-v line drop from the pole away from
its anchor on our house. The electric company line man
just walked up to the live 220-v wire, picked it up in his
bare hands, scraped it, and re-attached it. This was
one wire at a time, of course, but still I was amazed.
The dry New Mexico quartz sand doesn't conduct worth a toot.
Trying this in the moist East would immediately make your wife
a widow.

In article <11289@ucsd.Edu> brian@ucsd.edu (Brian Kantor) writes:
>53 MHz is used for model control and links and suchlike too.

The officially sanctioned RC channels are now spaced 20 kHz from 50.8
MHz to 51 MHz. i.e.: 50.800, 50.820, 50.840, . . . 50.980 MHz.

Please avoid using this section of the band, as you could cause
somebodies model aircraft to crash (and destroy 100's of $), or worse to
hit some person and KILL them. Think about it: an airplane that weighs
5 to 15 pounds, moving between 80 and 120 mph, with a meat cleaver up
front rotating at 20,000 rpm. One of these could do some serious damage
to a car also. Please avoid using 50.8 MHz - 51 MHz for any purpose
other than RC control of model vehicles.

>I was interested in hearing if anyone uses the 6 meter band. Of all the
>bands, I hear the least about the 6 meter band. Why is that? Why is
>it an unpopular band? Not only do I not hear much about it, but I see
>no new equipment for it and the used 6m rigs go for a song.

Well, I can try to answer some of your questions, I'm sure W9IP or someone
else will fill in the holes.

The 6 meter band is not unpopular, to the contrary for the hams who use it
it is very exciting. In the June VHF contest, for example, most stations
will have their highest QSO and multiplier totals on this band. 6 Meters
bridges the gap between HF and VHF - it has all of the standard VHF
propagation modes such as Aurora, Tropo, Scatter, E-skip, Meteor Scatter and
Moonbounce (earth-moon-earth), *plus* there are F2 openings that allow you
to work over paths between 5 and 10 *thousand* miles!

If you just go by the articles in this newsgroup, you'll come to the
conclusion that all hams either

1) tinker with gear,
2) have 440 rigs that are modified to listen out-of-band,
3) are active DXers or contesters, or
4) never get on the air and spend their time complaining about
the rules

True, 6 meters is hardly ever mentioned here. Few people, if any, use it in
their cars like the 2 or 440. You wouldn't want to use it for packet, the
baud rate is too slow. The antennas are bigger than you average 2 meter FM
antenna, but heck, they're smaller than a 20 meter beam! And true, there
isn't any really new gear coming out, but the functions that people need on
their new whiz-bang-smaller-than-a-credit-card handi talkies just aren't
needed or used on 6. 50 MHz attracts both DXers and VHFers, and it's a

great band for people who like both.

Eh? Between 50 and 220 MHz, the maximum symbol rate is 19.6 Kbaud. That's pretty respectable.

6m has a bum rap for causing TVI problems. Frankly, I have more problems on 20m operating 100w F1D than with keying a 5w 6m HT next to my TV...

From: Robert Carpenter <rc@cmr.ncsl.nist.gov>
Subject: Even more about 6 meters (LONG)
Message-ID: <9001260133.AA11840@cmr.ncsl.nist.gov>

This is extracted from a message I sent last July to someone who enquired about six meters. With the recent additional requests, I'm posting it for general information. Absolutely no endorsements are given, especially no endorsements from my employer.
****

Firstly, six is something of an acquired taste, I suppose. There is relatively little FM activity on six, and in any case I don't take part in it. I'm on the low end; the place where SSB/CW activity is concentrated. There is not much local rag-chewing on six. Except as mentioned below, there has been very little packet work on six.

Most of the SSB/CW operators on six are at least vaguely interested in radio propagation effects. One of the things that keeps many people on the band is that nearly every propagation mode know to hamdom happens on six at one time or another. It has held my interest for many years. Oh sure, I've done some operating on other bands, and have been pretty inactive for a year or so at times, but ....

OPERATION

Operation is mostly on SSB, but switching to CW is common for really weak sigs, and a few people operate nothing else. Per the FCC, SSB must be above 50.1 MHz. The DX calling frequency is 50.110 MHz. An attempt is underway to leave 50.100 to 50.125 clear from domestic QSOs, to give the DX stations a chance to be heard. With that in mind, a second (domestic) calling frequency of 50.125 MHz is in use. Only on the wildest of Es openings do you find SSB operation much above 50.200 MHz. On transatlantic opennings you find most French stations, and many of the Gs operating above 50.2 MHz. The are a few dozen

CW propagation beacons in the 50.060 to 50.080 MHz region in the US, and others elsewhere around the world in the 50.0 - 50.1 range. As well as signal reports, most stations exchange "grid square" information. On VHF and up bands, the world has been divided in 1-degree lat x 2-degree long "squares" which start at the south pole and date line and "read right up". I am in FM19, for example - actually FM19JB, each major "field" (FM) being divided 10x10 into 100 squares (19) and each "square" being divided 20x20 into 400 subsquares (JB). European stations like the subsquares; most US stations don't even know their own. In any case, the "squares" and their VUCC awards have been a wonderful interest builder, and have kept the QSL printers in business! I've now worked almost 400 squares on 6 since the "squares" business started on 1 January 1983.

RIGS

The equipment situation is easy to cover, so I'll do that now. Probably 50% of the active stations have 80 to 150 W output, either from old Icom 551D s (the 551 is 10 W), or from solid-state (brick) amplifiers following the many types of 10 W rigs. Perhaps 40% of the stations run just 10 to 20 W, but most of them either get an amplifier or drop out after a year or so. The remaining 10% have either tube rigs such as the Drake TR-6, Swan 250 (too drifty!), Heath SB110A (spurious sig 150 kHz or so from output), or high-power amplifiers. The kilowatt is quite rare on six (see below for why). The norm for "serious" stations is the 150 W amplifier. Last July I went through some of my grid-square cards for the station information contained thereon. Note that some of these cards go back six years and thus slight currently-available gear.
- "BAREFOOT" POWER - WITH AMPLIFIER
RIG <25W <100W >100W <kW kW
Drake TR6 7 2
Heath SB110 2 1
Homebrew 4 1 1
Icom 505 1
551 14 3 3
551D 21 2
560 2 1
Kenwood TS600 5 2 1
TS660 2 1
TS670 2 1
TS680 1
Swan 250 11 2
Transv/someHB 10 4
Yaesu FT620 6
FT625 6 2
FT690 3

FT726 4 1

TOTAL 56 25 21 12 15
(sum=102, 37 having < 25W, including amplifier)
(22 having 25-100W, incl. amplifier)
(43 having >100W, including amplifier)
I'm sure that this list slights the more recent rigs. It merely reports what has been on the air 1983-1989. No endorsements are given, your mileage may vary.

ANTENNAS

A beam is essentially necessary. Everyone is horizontally polarized, but cross-polarization doesn't matter for Es or F2. A few stations use 3-element beams, but a 4 or 5 element beam is so small that a LOT of people use them. Quite a few people have Cushcraft 6-element "Boomers". Mine really over-shadows the house with its 34-foot boom! There are a few other big beams, up to the M2 with a 50-foot boom, and the lunatic fringe stacks them, etc.. The higher the tower the better! RG8 or RG213 is plenty good enough cable for most people. Antenna-mounted preamps aren't needed. External noise is fairly high at 50 MHz. It overrides the front-end noise figure on about all the rigs on the market today unless you have a LOT of cable loss or a VERY quiet location.

Also from my cards: (largest beam = 44 elements!)
NUMBER OF ELEMENTS
<3 3 4 5 6 >6
this size 9 8 15 22 30 19
HEIGHT (FEET)
<26 26-55 56-100 >100
this height 10 35 18 3

PROPAGATION

Tropo - The ordinary ground-wave tropo range on six isn't quite as great as on two. There are a number of reasons. Since there are so many other prop modes on six, people don't try so hard on tropo. Antenna gain often is higher on two. Noise is lower on two. At least in the summer, stations like W3BWU (Pittsburgh), W3IDZ (northern NJ) are easily worked from here with the beam pointing at them, and can be heard at almost any pointing. They are in the 150-W class.

Meteors - Any area workable by meteors can be worked more easily by Es or aurora. Even though meteor sigs are much stronger and longer on six than on two, little use has been made of them. There has been a VERY little meteor-burst

packet work on six. I had the first such contact (with W0RPK). W3XO worked him a few years later.

Ionoscatter - Some people think it's really meteors, but every weekend morning there are a number of nearly-kilowatt stations working each other on SSB at distances of about 600 - 1000 miles by ionosperic scatter. Sigs are weak, and it takes good beams, height, and power, but it is very reliable. See the old NBS papers by Bailey, Bateman and Kirby, et al. Bateman and Kirby were/are hams. Ross Bateman died last year. Dick Kirby continues as head of CCIR in Geneva.

Aurora - Much easier than on two. SSB is usually intelligible. Point north about dusk, most commonly in March and October/November. Lots of people work this mode when it happens.

Es - You know something about Es from TV DXing and "short skip" on ten meters. Having much better antennas, modulation, and receivers, hams do a lot more with it on six than you are used to on channel two TV.
It is most common from May to August, and around Christmas, here in Northern latitudes. In addition to the common single-hop range of 500 - 1500 miles, there are quite a few double-and-more hop contacts on six. Now that a number of Europeans are on six (with LOW power), we find that they can be worked from the US east coast each summer. Likewise the Caribbean stations work all over the US. The US west coast has an easy time with Hawaii and Alaska.

F2 - This is the traditional world-wide F-layer propagation you know and love from 20 and 15 meters. At most sunspot maximum periods, a few years of each eleven, the MUF reaches above 50 MHz in the autumn and spring. It isn't every day, but even antipodal communication has happened. The leaders have now worked over 100 countries. But they have spent MANY hours over many years trying to catch the fleeting opening. F2 brings an influx of the lower-band DX operators. The normal rather gentle operating style gets somewhat lost at those times.

Transequatorial Propagation - The southern US gets a number of openings to South America by some kind of ionospheric aly-ducted propagation. The stations are generally about equidistant either side of the magnetic equator. Given exceptional luck, an Es opening linked into this mode can make it available to more northern stations. This mode has bad flutter fading and a touch of the auroral spectrum spreading. This mode also works sometimes on two meters if you use CW and really good

gear. It has been worked on 432 MHz.

EME - There have been a few EME contacts on six, but the
required extreme antenna size and transmitter power make it
out of the reach of most people.

Did I leave any modes out?

TVI, ITV

There is no doubt about it, six has TVI troubles. You
find a limited number of people on six in channel 2 areas
unless cable is widely subscribed-to. Many VCRs and
audio systems are also prone to six-meter pickup. The
common connecting or power cable is a quarter-wave
antenna for six .... The TV owners have their revenge
since the 13th harmonic of the color subcarrier, or
something, of TV sets and TV games puts out a birdy at
50.113 MHz to bother the six-meter operators in return....
There is also quite a bit of trouble from noisy power
distribution lines if they aren't buried (usually bad
insulators or poor guy bonding).

STILL INTERESTED?

That should be enough to hold you for a while. Listen
to 28.885 MHz, the ten-meter liaison frequency for
overseas six-meter DX.

73,
Bob W3OTC

Subject: Need info on rechargable Alkaline battery
Message-ID: <3738@mmsac.UUCP>

I recently aquired an old Motorola VHF Hi lunchbox radio. It
is a one-channel FM receiver/transmitter, and it puts out about 1
watt. It has a rechargable 6-volt, 4 amp-hour battery in it, that is
dried out, and doesn't work. If I supply 6 volts at about 1.5 amps to
the radio externally, it works fine.

Now, the battery has little screw-top covers on each cell, and I can
see the little sheets of metal and what looks like cardboard inside,
but it is completely dry.

Can I make this battery work again? Would it work if I put
hydrochloric acid in the cells (like from a car battery)? It says on
the side of the battery that it is a rechargeable alkaline battery,
and should only be charged with an approved Motorola charger.

Is there some kind of alkaline liquid I could put in it to make it work?

Any info would be helpful.

Message-ID: <1389@ariel.unm.edu>

One suggestion I haven't seen so far is de-imaging the stock quotes given on whatever the "business channel" is (I don't have/watch cable TV (yet))... I've seen this on other's cable-connected veletisions on occasion.

Now, from (dim) memory, I recall an article in 73 Magazine from back before direct ASCII transmission was legal on our bands...someone showed that you could put letters on a SSTV image, transmit it LEGALLY (Uncle Fox said so!) and pick the image apart at the end to get your text. It was an administrative kludge, rendered pointless by authorization to use ASCII, but the idea may be useful here.

The image (as I recall) has a small rectangular portion of the screen display-ing stock quotations in a moving-strip (ticker-tape?) fashion. A frame grabber could "grab" every few seconds, and only a small portion of the image would need to be processed, so it should go quickly, and you generate a nice little tickertape file.

I don't know:
o How much it would cost
o How quickly the processing REALLY could be done
o How "old" the televised quotes are
o If anyone really gives a damn

There's the idea. Now, kick it around a bit.

Have fun,
n5gax

SUCCESSFUL LAUNCH OF SIX NEW AMATEUR RADIO SATELLITES

HR AMSAT NEWS SERVICE BULLETIN 023.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990

TO ALL RADIO AMATEURS BT

After nearly three years of hard work by scores of dedicated AMSAT volunteers, there are finally six new amateur satellites in orbit. At 01:35:31 UTC on January 22, 1990, ESA successfully launched it's V35 mission, an Ariane 4 booster, from its launch facility in Kourou, French Guiana. On board were six amateur radio satellites, two built by the University of Surrey, UO14 and UO15 and four microsats built by AMSAT-NA, AO16, AO17, AO18, AO19. An errant tape recorder on the primary payload, SPOT-2 delayed the launch from January 9th and bad weather in the area brought about a scrub of the launch on January 21. However, the picture perfect launch occured at the beginning of the ten minute launch window Sunday evening local time.

The AMSAT Launch Information Network Service (ALINS) brought the launch "live" to thousand of amateurs and interested on-lookers world wide. Doug Loughmiller, KO5I, President of AMSAT-NA, anchored the net which could be heard on the ham bands covering 160 meters all the way up to AO10 and AO13. Also heard on the ALINS net were a number of the major contributors to this latest effort. Commentary prior to the launch was offered by Tom Clark, W3IWI, Jan King W3GEY, Martin Sweeting, G3YJO, Jeff Ward G0/K8KA, Harold Price NK6K, Dave Cowdin WD0HHU and Bob McGwire N4HY. It was noted that this was also an anniversary for the ALINS net. It was twenty years ago, on January 23, 1970, when the first ALINS net covered the launch of Australius-OSCAR 5.

Doug Loughmiller, watching the ESA video feed of the launch, counted down to ignition and liftoff. AMSAT's Dave Cowdin, who had been at the launch site for over 5 weeks gave updates on the progress of the mission from his position at ESA mission control. At about three minutes into powered flight (during the second stage burn), the launch commentary ceased. For over a minute, neither Dave Cowdin or Tom Clark, who was monitoring the launch from the NASA Goddard Space Flight Center in Greenbelt MD offered any information. This silence had certainly activated the adrenaline glands and stopped the breathing of those who were listening. One voice offered some comfort, explaining that ESA had never had a second stage failure in any of its missions. Finally Dave's voice came through indicating that all systems were "still GO" --- and with that message, those listening could begin to breath again. As part of the elation felt by the development team, Harold Price (a member of the software team) indicated his delight in recognizing that the satellites were no longer within the grasp of the hardware team, and that the satellites were "all theirs".

At 20:04 minutes of mission elapsed time, ESA issued a payload separation command to its launch vehicle and UO14 and UO15 were freed. A minute and a half later at 21:29 mission elapsed time, ESA issued two more payload separation commands and AO16, AO17, AO18, AO19 were released. Dave Cowdin reported that the six separation lights were "All Green" indicating confirmation that all six Amateur Satellites had successfully separated from the launch vehicle.

Dave Cowdin indicated that AMSAT was treated in a most professional manner by ESA. Although the primary payload, SPOT-2, (a $100 million observation satellite) was ESA's primary concern, applause from ESA mission control could

be heard over the ALINS net as the six satellites were separated from the main launch vehicle.

During the first orbit, AMSAT-LU in Buenos Aires commanded the CW beacon to commence transmitting, and it provided vital temperature and battery voltage information to the satellite command team. Although attempts by N4HY to turn on the PSK telemetry beacons during orbit 1 were unsuccessful, all of the Microsats were transmitting by the end of the last pass (orbit 3) over the west coast, around 0700. Spacecraft engineers Harold Price and Jan King, operating from W6TRW, indicated that the satellites had either responded to ground command or had switched on transmitters automatically in order to prevent battery overcharging. WEBERSAT was succesfully commanded on from Weber State College in Ogden, Utah during orbit 2. UO-14 and 15 were activated during the first opportunity visible from the University of Surrey on orbit 5.

PRE-LAUNCH MICROSAT KEPLERIAN ELEMENT SET

HR AMSAT NEWS SERVICE BULLETIN 023.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

SPOT-2 / MICROSAT / UOSAT KEPLERIAN ELEMENT SET

The following element, originally provided by ESA as relayed by N4HY has been modified by W2RS to more closely predict observed AOS and LOS times:

Satellite: SPOT-2, UO-D, E, Microsat-A, B, C, D
Catalog number:
Epoch time: 90022.0778588
Element set: Kourou-1
Inclination: 98.73 deg
RA of node: 97.9558 deg
Eccentricity: 0.0013
Arg of perigee: 93.9 deg
Mean anomaly: 302.31 deg
Mean motion 14.28575 rev/day
Decay rate: 1.0e-05 rev/day^2
Epoch rev: 0
Appogee 816.0 km
Perigee 798.1 km

The following element set for PACSAT was provided by RGO via G3AAJ.

Satellite: AO-16
Catalog number:
Epoch time: 90022.77211779
Element set: RGO
Inclination: 98.7092 deg
RA of node: 99.2408 deg

Eccentricity: 0.0003323
Arg of perigee: 185.4669 deg
Mean anomaly: 178.4316 deg
Mean motion 14.28180195 rev/day
Decay rate 7.9248e-04 rev/day^2
Epoch rev: 10

Whatever element set you are using, allow some tolerance in pass times and antenna pointing until information starts to become available from the standard sources.

MICROSAT AND UOSAT FREQUENCIES

HR AMSAT NEWS SERVICE BULLETIN 023.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

MICROSAT AND UOSAT FREQUENCIES AND DEPLOYMENT ORDER

The following are the Microsat and UoSat listening frequencies, data rates, and modes for the first few weeks of operation and check out.

Spacecraft OSCAR number Frequency, MHz Mode

UoSat D UO-14 435.070 1200 bps AFSK (FM)
UoSAT E UO-15 435.120 1200 bps AFSK (FM)
PACSAT AO-16 437.025 1200 bps PSK AX.25
DOVE AO-17 145.825 1200 bps AFSK AX.25 (FM)
WEBERSAT AO-18 437.075 1200 bps PSK AX.25
LUSAT AO-19 437.150 1200 bps PSK AX.25
LUSAT - CW LUSAT 437.125 12 WPM CW telemetry

Packet transmission from DOVE may be monitored with an unmodified TNC-2 or clone, using an FM receiver. The other microsats (PACSAT, WEBERSAT, and LUSAT) require an SSB receiver and TNC with a 1200 bps PSK demodulator (FO-12 compatible, NOT the 400 bps PSK demodulator used with AO-10 and AO-13). The modulation scheme used by the UoSats is compatible with UO-11.

PREPARATION FOR SAREX OPERATIONS WELL UNDERWAY

HR AMSAT NEWS SERVICE BULLETIN 023.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

Although the past few months have seen much attention focused on the Microsat/UOSAT launch, there is yet another amateur space spectacular to take note of. In April Ron Parise (WA4SIR) will be an astronaut on the next flight of the shuttle Columbia. Ron will be flying a SAREX

(Shuttle Amateur Radio EXperiment) payload.

Ron will be taking the Motorola HT plus packet hardware. The SAREX packet hardware is a 1990 version of what we had hoped to fly in 1986 when the Challenger disaster caused a schedule setback. In 1986, we planned a radiation-hardened 16K TNC2 -- the 1990 version is a radiation-hardened Heath/Tasco HK-21 "Pocket Packet" with 32k of RAM. The Support computer has evolved from a small Radio Shack Model-100 (which we would have had to provide) to a Grid laptop PC clone (which is a standard item on the orbiter).

For the 1986 mission we had planned a "ROBOT" QSO machine which could work up to 9 people simultaneously, which had the capability for sending a long (1.7 kbyte) "Meta-beacon" and which could also be used as a "normal" TNC if there were real time QSOs. The 1986 firmware was tested in several locations and on two aircraft tests and proved to be very robust. The 1990 SAREX TNC firmware is an updated version of the earlier code. The major functional change is that the TNC now has enough RAM to store 650 QSOs, which in turn solves a major operational problem that would have existed in 1986 when the "worked" logs would have had to be downlinked in real time and assembled from beacons. As with the earlier software, stations only appear in the "worked" log the first time they complete a QSO -- no dupes! There has also been a minor change in the dupe definition in that the log drops any SSID, so a QSO with K9DOG-4 is a dupe if K9DOG has been worked earlier.

During the winter of 1985/6 there was a lot of interest in having SAREX demo stations in several parts of the country. Those stations who would like to offer their services a demo station should contact Tom Clark, W3IWI, or Courtney Duncan, N5BF, through AMSAT Headquarters.

QSL CARDS FROM U2MIR HAVE ARRIVED

HR AMSAT NEWS SERVICE BULLETIN 023.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

Ray Soifer W2RS recently reported that he and KZ1Z have received QSL cards from U2MIR. They were mailed 29 DEC 89 from Moscow and was signed by UW3AX. Those stations who contacted U2MIR while he was in orbit should be checking their mailboxes over the next few days for this rare collector's item.

MICROSAT'S EDAC COUNTER REFERENCES SET

HR AMSAT NEWS SERVICE BULLETIN 023.06 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 23, 1990
TO ALL RADIO AMATEURS BT

The current early orbit software for the four Microsats does not record EDAC errors (Error Detection And Correction circuitry for the on-board memory), it only reports the status of the EDAC counter. The counter comes up in a random

state when power is first applied. To determine the number of EDAC errors occuring during the first few days, the values of the counters at initial power up are listed here:

DOVE: 0xaa LUSAT: 0x0b PACSAT: 0xd8 WEBER: 0x22

Note that a large count value does not necessarily indicate a large number of radiation hits. Counters are incremented each time effected bytes are read from memory, but are only corrected when those bytes are written to memory during a memory wash cycle or ordinary data manipulations. If an effected byte is located in a part of software that is executed many times, many errors may be registered before the wash correction occurs.

Subj: microsat elements

Here's a set of elements for what are being called 1990 005A and 1990 005H, since they were not included in Max White's list. These came from Kelso's Celestial BBS.

1990 005A
1 20436U 90 5 A 90 23.82409993 .00004306 00000-0 17953-2 0 77
2 20436 98.7217 100.2931 0003389 178.5625 181.5624 14.26691687 258
1990 005H
1 20443U 90 5 H 90 23.82219061 -.00030107 00000-0 -12187-1 0 73
2 20443 98.7165 100.2885 0010048 210.8523 149.2068 14.28223237 250

I didn't include his other sets because the ones Max White provided have later epochs.

I wouldn't make ANY assumptions about which of the 8 element sets correspond to which real objects, including SPOT and the launcher. At the moment 005B is well ahead of the pack and 005A is well behind, with the others bunched in the middle. C and E look almost identical. I'm not sure what all this tells us, since I don't know what maneuvers (if any) were done by SPOT and the launcher after separation, nor do I know the precise velocity vector of each separation.

If we could get radar cross section data we could narrow things down, but lacking this we'll have to wait for all the objects to spread out. Then we can tell NORAD which is which. (I note, rather wryly, that they're part of the same organization that says they'll have no problem telling, with absolute reliability, the difference between an incoming nuclear warhead and a decoy in a matter of minutes...but I digress. :-))

Subj: First Microsat program load

The first post-launch software was uploaded to WEBERSAT this evening. The upload was started on the east coast by N4HY and completed by NK6K @ W6TRW on the west coast. We'll use this technique of uploading large programs over several passes by multiple command stations to counter the relatively short access times.

During the first pass over LA, the satellite was getting perfect copy of 152-byte packets while it was still near the horizon, with 25 watts into a klm-22c. We didn't try to see how low with RF we could go, as

we wanted to get the software in. It appears that the satellites will be
as easy to get into as we hoped. Receiver sensitivity and channel centers
will be calibrated in the days to come.

An improved loader in now running on WEBERSAT, although the new battery
control algorithm is not yet loaded.

The weber transmitter was off from Fri Jan 26 05:06:30 1990 UTC until
Thu Jan 26 06:37:06 1990 UTC. The UTC date on weber was set to 1989
by mistake, this will be corrected in the morning.

We are still in the process of installing factory field upgrades to
webersat in preparation of turning it over to the "customer" sometime
next week.

Harold

This kind of reminds me of the "monster cable", or something like that,
which is being advertised to "audiophiles" as being better for your stereo
system - less distortion, more power to your speakers, "you can hear the
difference". You know, the cables with like 1/4" copper conductors rated
at 10000 Amps or something ungodly. The word "overkill" becomes an
understatement...

Makes me laugh every time I see one of those ads. I actually have seen
people spend the $1 per foot for this stuff.

From: Mike Owen W9IP <MROWEN%STLAWU.BITNET@CUNYVM.CUNY.EDU>
Subject: 6 meters

In a recent posting, "Dr. MegaByte" asked about
usage of the 50-54 MHz (6 meter) band. I would
like to echo the response made by Jim, AD1C: Yes,
6 meters is very heavily used and is extremely
popular among VHFers. I'll bet that over 90%
of the weak-signal (i.e. SSB/CW, non-FM, non-ATV)
VHFers have 6-meter gear.

You may _perceive_ that 6 meters is unoccupied for
several reasons. First, its activity is strongly
seasonal. E-layer propagation is about nil during
most of the winter, so many 6-meter ops don't get on
the air except during the summer. Second, the "ground-
wave" [bad term, I know...] range on 6 meters is not
great, so unless you live within about 50-75 miles of
an active station, you may not hear much day-to-day
activity. Lastly, it takes a beam antenna to get good
results on 6 (just like on the higher VHF bands). So if
you're a casual listener, perhaps using just a scanner
and vertical antenna, you will not hear much of the activity
that's actually there.

6 meters is VERY alive and VERY well, thanks to recent F2
DX openings to Europe, Japan, and S. America. Concentrate
your listening in the range 50.1 - 50.150 (especially .110
and .125) and you may get a case of 6-meter fever, too.

Mike Owen, W9IP/2

From: "V5120::ZWIRKO" <zwirko%v5120.decnet@nrl3.arpa>
Subject: ARRL January VHF Test

More observations of the ARRL January VHF SS (1-20/21):

Here in the Maryland D.C. area conditions were reported to be poor on all bands. 6m offered only a few meteor scatter contacts, while 2m and up offered only some slight enhancements to the south and west...At this QTH New England and W. NY were barely heard, which was highly unusual. Unfortunately no Aurora this far south on Sunday evening.
Some best DX on the various bands from FM18 were:
6m - K5CM (EM25) & WA0BWE (EN34)
2m - N4EQT (EM77) & VE3ASO (FN25)
70cm - VE3ASO (FN25) & K4LVV (EM96)

We were all quite fortunate here in the Mid-Atlantic, not to be hit by the ice/snow which plagued those north of us. As a matter of fact it was partly sunny on Sunday with temps. in the mid-50's.

The rough setup here was 300W & 6L@35' on 6m, 300W & 19L@40' on 2m and KW & 27L@ 45' on 70cm (lost my GasFet mid-test).

I, also like Dave (KM3T), used the K1EA ConTest logging program, which really is a pleasure! The 3Band score is as follows:

Band QSO QSO Points Grids
50 142 142 32
144 229 229 34
432 92 184 19
----
463 555 85 ------> 47,175 points

Some other (rumored) point scores from 5Band op's here in MD were:

K1RZ - 105.1K
NW5E - 93.9K
W3IP - 86.7K
W3ZZ - 81.2K

PROPAGATION FORECAST BULLETIN 4 ARLP004
FROM ARRL HEADQUARTERS
NEWINGTON MT JANUARY 22, 1990
TO ALL RADIO AMATEURS

OVER THE PAST FOUR WEEKS AND ABOUT ONE COMPLETE ROTATION OF THE SUN, THE WRITERS CHARTS OF SOLAR DATA LOOKED VERY MUCH LIKE THEY DID FOR DECEMBER. THERE ARE ALWAYS SOME SIMILARITIES FROM ONE ROTATION TO THE NEXT, BUT WE HAD TO GO BACK TO SEPTEMBER 1987 TO SEE AS MUCH SIMILARITY AS WE HAVE OF LATE. OUR JANUARY CHART APPEARS TO BE NEARING ITS MUF PEAK AS THIS IS BEING WRITTEN, BUT WE COULD BE SEEING THE HIGHEST SOLAR ACTIVITY YET OF CYCLE 22 IF THE RISE CONTINUES AT ITS PRESENT RATE. THE FLUX ROSE FROM 198 TO 265 IN FOUR DAYS. A FEW MORE DAYS AT THIS RATE WOULD BRING A NEW HIGH FOR CYCLE 22.

NEW OUTBREAKS ON THE SUN ARE ACCOMPANIED BY BOTH HIGHER NOISE LEVELS AND A AND K INDICES, NONE OF WHICH ARE BENEFICIAL TO HF DX. ONCE THE PEAK IS REACHED AND THE SOLAR FLUX CURVE STARTS DOWN AGAIN, COMMUNICATIONS MAY IMPROVE, BUT WITH SOME LOSS OF MUF. OFTEN THERE MAY BE OPENINGS UP TO 50 MHZ, AT LEAST FOR SHORT PERIODS, ESPECIALLY ON TRANSEQUATORIAL PATHS.

LOOK FOR THE LOW POWER CW BEACONS BETWEEN 28200 AND 28300 KHZ AND 50 AND 50.1 MHZ. MOST OPERATE CONTINUOUSLY REGARDLESS OF PROPAGATION CONDITIONS.

AMERICAN SUNSPOT NUMBERS FOR JANUARY 11 THROUGH 17 WERE BETWEEN 126 AND 156 WITH A MEAN OF 137.1. AR

Subject: J-pole Antennas.
Message-ID: <26 Jan 90 10:27:14 GMT #5043@UK.AC.NWL.IA>

The J-pole: yes it is esentially a 1/2 wave element with
a 1/4 wave matching stub at the base. As to the end impedance of a 1/2 wave,
well, there have been various claims for this, ranging between 500 and 5000
ohms.... There will be numerous factors affecting this - whether the element
is in free-space or not, the ratio of length to diameter of the element
(make it out of wire and its impedance will be higher than if it is of
large cross-section).
A 'fat' element will also have a wider bandwidth.
I have used 1/2 wave elements fed with conventional transformer matching,
i guessed the approximate ratio as being something like 15:1 and moved the
tap on the transformer to get maximum radiated field-strength.... It
worked!.
Remember, the *calculated* impedance and the *actual* impedance are only
ever the same if you are in free space (in other words theres nothing for
thousands of wavelengths in any direction...)

Anyone who expects to design and build an antenna and have it work 'straight
out of the computer', is grossly optimistic. Only fools calculate their
impedances, then expect to see a real antenna fit the theory!

If interested in the 'j-pole', also look up the 'Slim Jim' (a sort of
'folded j-pole') designed by Fred Judd G2BCX. It is about the same size as
the traditional j-pole, but about one and a half dB more efficient.

///Pete G6WBJ

Message-ID: <13900015@m.cs.uiuc.edu>

I fly R/C and use 6 meters on some of my systems. Since the imports ran US companies under the table, it is tough to find 6 meter systems.

I got mine from Royal Electronics, in Denver, which no longer makes systems. I have quite a few spare servo gears, etc, so manage to keep them alive.

At this point in time, the only US manufacturer that I know of who might assist you in this is ACE R/C, in Higginsville, MO. I am at work and do not have any magazines handy, but I would think that if you called information, got their phone number and called, you could find out what is available.

ACE has kits, and the last time I knew, they still carried 6 meter equipment. As far as conversion of equipment on the market, I do not feel it would be worth it, I have built homebrew R/C hardware in the past and it gets costly to get the correct coil forms, crystals, etc, that fits the existing boards that you would find in the systems, especially when you are buying in low quantity. Additionally, all systems in this country (most anyway) come from across the pond and US parts just do not have the same sizes, etc.

Message-ID: <9124@dime.cs.umass.edu>

Read in recent Scientific American (Apr 89) about a solar sail race, a race in space for light crafts powered by the photon pressures.. Three entries are being planned etc. One each from Europe, Asia, and America.

I remember a blurb in a QST long time back about Ham interst in Solar Sails, for the amateur sattelites .. are any Hams involved in this too ?

The article also mentions India, among the countries with active groups working on solar sails. Anyone have pointers to such people in India ?

And if the exchanges find out that you have been recieving the data, they will come after you directly for theft. The exchanges are considered a quasi-govermental agency, and they *will* prosecute. Also, if you have executed any trades using this information, there are additional penalties. In theory, you could avoid this by paying the exchange fees. However, since the forms that must be filled out for the exchange fees include sections for *how* you are recieving the data, filling in "Intercepted from FNN Signal transmissions" would likely get you in hot water.

You might ask how you would be caught. And I don't have an answer for that. I do know that it wont go well for you if they do catch you, since the least you will have to do is pay all of the past fees you skipped on -- which are about $100+ a month PER EXCHANGE.

The FNN Signal broadcasts are encrypted, but I believe the method is trivial to crack. You will need to work out the transmission formats, which are much more complex.

Just a word of warning...

A few years ago there was a special issue of IEEE proceedings that gave a complete rundown on the shuttle and proposed space station. It was very thougher, with frequencies etc. (Some would probably have changed by now though)

HAM SATELLITES' LAUNCH DELAYED UNTIL JANUARY 21

On January 8, Arianespace officials announced that the V35 launch of the Amateur Radio Microsat and UoSAT satellites will be delayed further due to problems with the non-Amateur Radio SPOT-2 satellite, which is the primary payload of the mission. The problem with SPOT-2 was due to a magnetic tape recorder failure. The launch is now scheduled for January 21 at 01:35 UTC.

from Bob McGwier, N4HY and Eric Rosenberg, WA6YBT via CompuServe's HamNet

SKIPNET STA EXTENDED

The FCC has granted a one-year extension of the STA (special temporary authority) for automated packet-radio operations on HF for SKIPNET participants. This January 4 action is in direct response to an ARRL request.

ARRL AWARDS FIRST GRANT FOR HF PACKET-RADIO RESEARCH

The ARRL made its first technology grant of more than $1000 to a team of investigators headed by Stephen Hall, WM6P, for research in diversity reception of HF packet-radio signals. Co-investigators in the team are Andy Demartini, KC2FF, Wally Lindstruth, WA6JPR, Bill Lake, WB6RIJ, Herb Duncan, WE7L, and Peter LaCount, W8UXD.

The objectives of this work are to investigate the benefits of diversity reception for HF packet radio, design practical diversity antenna systems, modem characteristics and receiver design for diversity. Funds provided under this grant are for purchase of equipment, electronic parts and other out-of-pocket expenses in connection with this research. The team members donate their volunteer labor and much of their own equipment in carrying out this work.

NEW VERSION OF ARES/DATA AVAILABLE

Version 1.1 of ARES/Data is now available. The new version of this multiconnect, multiport, generic data base program for the IBM PC and compatible computers provides the following three new features.

A STATUS command provides a brief status of the system, ie, the current LABELS and WIDTHS settings and the current data base size.

An automatic Origin Indicator at the beginning of the MESSAGE field indicates which station last updated each record. The station's call sign or the word "SYSOP" will appear here, so in case of data entry errors or other questions, everyone will know who made each entry.

A WIDTHS command allows you to more neatly format output data on the screen. It does not change the data in any way, but provides a way for the column output to "look right." If the value for any field is shorter than the defined WIDTH for that field, when that record is displayed, spaces will be used to keep the fields aligned. If a given value is longer than

the specified WIDTH, then all of the value is displayed.

The program may be downloaded from CompuServe's HamNet or may be obtained by sending a blank disk (5-1/4-inch 360-kbyte or 3-1/2- inch 720-kbyte) and return postpaid disk mailer to:

PACKET RADIO MANUAL IN BRAILLE

Northern Nevada Braille Transcribers, a volunteer, nonprofit, tax-exempt group, now has the MFJ-1270 TNC 2 Packet Radio Owner's Manual available in braille. It is contained in six volumes of various lengths. It is also available on an Apple computer floppy disk. This braille manuscript is available without charge to anyone who can use it, however, contributions in any amount are gratefully accepted. Interested parties can write for additional information to Northern Nevada Braille Transcribers, 1015 Oxford Ave, Sparks, NV 89431.

from The ARRL Letter

Volume 6 - Number 9 - January 19, 1990 - Part 2 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED

Much grumbling is heard these days about bulletins in the PBBS network. The complaints include such things as there are just too many bulletins for PBBS users to sift through, many of them have inappropriate distribution (items of purely local or regional interest being propagated around the world), you often can't tell what the subject matter is without reading them, important local items are missed in the hodgepodge of bulletins from afar and so on. To a certain extent, these are problems of user education. PBBS users need to be informed more emphatically not to send "for sale" items to @ALLBBS, to use more informative Subject lines, etc. The real problem, however, is that PBBS SYSOPs lack the bulletin management tools which would allow them to bring some order to this chaos.

Anyone who uses landline BBSs, information utilities such as CompuServe, or computer networks such as USENET, already has an appreciation for one major shortcoming of PBBSs. Unlike those systems, the packet-radio systems have no means of subdividing the bulletins (which usually go by different names on other systems) into different categories or special interest areas. Therefore, users have to wade through everything from soup to nuts (especially the latter!) to find the few items of interest to them. This wastes time and precious channel bandwidth. One partial solution to the problem is to use the To: field of bulletins to categorize them; then astute PBBS users can use commands like "L> XXXX" to find bulletins related

to the area designated by "XXXX." KA1NNN has proposed a list of categories (as published in Gateway, Volume 6, Number 2, and also distributed on the PBBS circuit) and some categories are already in use in some areas. This is by no means a complete solution, but it is a good first step and one which PBBS SYSOPs should strongly support.

In considering what other changes might be made to the packet- radio bulletin distribution system, it is useful to examine how those other systems mentioned above handle similar tasks. I would like to focus on USENET because I believe it offers the most useful model from which we can learn, but there are certainly others worth examining, such as the Fidonet BBS network.

Although USENET is not a BBS, it has some notable similarities to the PBBS network. It has been described as "a kind of grass roots network based on controlled anarchy." Sound familiar? The network consists of more than 5000 computer sites, ranging from huge mainframes to lowly PCs. What they have in common is the UNIX operating system (or at least the ability to communicate with UNIX systems). In USENET, "bulletins" are articles posted by users of these systems and the articles collectively make up the USENET "news." The news is subdivided into approximately 300 different "newsgroups" and articles are propagated amongst the participating systems by a flood routing scheme very similar to that used for packet-radio bulletins. Of course, the medium of propagation is different, typically being telephone dial-up or leased lines, and the volume of news is considerably greater.

A USENET user accesses the news by logging into his host system and running a "newsreader" program. Most systems have several such programs available, each with a different user interface. They all make use of a configuration file in the user's home directory, which lists all of the newsgroups. For each newsgroup, this file indicates whether the user has "subscribed" to it (ie, whether the newsreader will show him articles from that newsgroup) and which article numbers he has read. While reading an article, the user has options such as sending a copy to a file or to a printer, posting a follow-up article or sending private e-mail to the author.

Articles can also be posted without running the newsreader by using a different program, usually called "postnews." This is typically used when the article is not a follow-up to a previous article. The program first asks for a subject, then some key words that can be used for searching and then the name of the newsgroup in which to post it. More than one newsgroup can be selected ("cross-posting") in instances where the article's content spans several areas of interest. If the user is unsure of what newsgroups are available, the program can provide him with a list. The program then prompts for a distribution area for the article. There are usually about six choices (eg, local site only, metropolitan area, state or province, country, continent, worldwide); each newsgroup will have a pre-defined default distribution area which can be accepted by simply hitting Enter. Then the user is transferred to an editor to create the body of the article. Doing a follow-up article is easier because all of

the preliminary details (newsgroup, key words, subject, distribution) are picked up from the article to which the user is replying.

One other interesting aspect of newsgroups is that some of them are moderated. This means that users are not allowed to post articles directly from their site into that group; instead, they must be mailed to a moderator, who posts them only after determining that the contents are actually a useful contribution to the discussion. This sounds like censorship, and moderated groups are in the minority on USENET, but a good moderator can really keep the noise level down and the quality level up.

(continued next message)

Volume 6 - Number 9 - January 19, 1990 - Part 3 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED
(continued from preceeding message)

Since there are a great number of USENET newsgroups running the gamut from highly technical and specialized to completely frivolous, a hierarchical naming system has been developed to make them easier to handle. A newsgroup name consists of two to four sections, separated by periods, proceeding left to right from the general to the specific. At the top of hierarchy are some broad topic areas such as "rec." (recreation/arts/leisure), "sci." (science and technology), and "comp." (computers). The newsgroup that deals with general topics of interest to hams is rec.ham-radio, but there is also a more specific newsgroup devoted to packet radio, known as rec.ham-radio.packet. The group for discussing IBM PC compatibles is comp.sys.ibm-pc, and so on. A few of the newsgroup names indicate geographical or institutional areas rather than topic areas. Since many of the USENET sites do not want to carry all of the newsgroups, the hierarchical naming system makes it much easier to specify which groups will be accepted by a particular site.

An interesting aspect of the anarchic nature of USENET is the way in which new newsgroups are created. There is no central authority to organize such things, so it is up to the initiative of individual users to start the process. Proposals for new newsgroups are discussed, often heatedly, in a particular newsgroup which was created for that purpose. After a suitable period, if there appears to be enough support for the new group, someone will begin collecting votes, which are sent in by e-mail. After the prescribed period, the results are posted to the net, usually accompanied by a list of the voters and how they voted. If there are at least one hundred more "yes" votes than "no" votes, the newsgroup is declared to be created. Control messages are sent out, which cause the Netnews software to automatically add the new newsgroup to the USENET distribution. Most users will have their newsreaders configured so that they will see new newsgroups when they appear. They then can "unsubscribe" if they do not wish to continue reading the new additions.

How does this relate to the PBBS network? There are obviously some aspects of USENET which don't apply, but there are also some useful lessons we can

learn. The notion of newsgroups is embodied in the To: field categories mentioned earlier. The limitation of six characters should be removed, possibly making way for a hierarchical naming scheme. The naming of the newsgroups will probably continue to evolve haphazardly for a while with some catching on and becoming popular and others falling by the wayside through lack of use. At some point, it would be desirable to formalize the list of existing newsgroups, and institute some sort of voting procedure for adding new ones. Since the packet-radio news network will presumably continue to emphasize topics related to ham radio, as opposed to everything under the sun as on USENET, I don't expect that the number of newsgroups needed will be nearly as large.

The other important aspect of bulletin/news distribution is the geographical distribution areas, which belong in the @PBBS field of bulletin-type messages. I would like to see a clean division between newsgroups and distribution areas so that the @PBBS field is used for the latter function only. This means that bulletins that are presently distributed to ALL@AMSAT, for instance, would instead be addressed to AMSAT@ALLBBS or, perhaps, SPACE@ALLBBS. If you were entering news on satellite passes in your own area, you would then address it to SPACE@LOCAL (where LOCAL is replaced by whatever is appropriate for distribution in your area). I believe that half a dozen or so distribution areas, ranging from local to worldwide, is all we really need in the @PBBS field. This would be supplemented by a file listing all of the newsgroups, along with various attributes which control how they should be handled by the PBBS.

Among the possible attributes for a given newsgroup are: don't accept articles for that newsgroup; accept articles, but don't retain them locally (for feeding other PBBSs who want that newsgroup); accept articles and make them available to users; archive articles in that group into a text file, etc. The newsgroup file would also be referenced for forwarding purposes, if there is a need to forward only selected newsgroups to other PBBSs.

In order to effectively manage the news (I'd like to get away from calling it "bulletins"), some major changes in the PBBS software is needed. There should be more help available to users entering news articles, so that they can easily get a list of available newsgroups and distribution areas that can be used. The SYSOP needs tools which allows him or her to define these items and also to establish linkages between them which can be used to prevent inappropriate distribution. It should be possible, for example, for the SYSOP to set a limit on distribution area for "for sale" items, and thus prevent the 4SALE@ALLBBS sort of abuse that we have been seeing lately. It should also be possible to set up controls so that articles from users that have very wide distribution are flagged and put on hold so that the SYSOP can review them before deciding whether they should be unleashed on the world. This adds a burden to the SYSOP, but seems to be the only solution to curbing the abuse we are currently experiencing. The situation should improve in time, as the level of user education improves.

Volume 6 - Number 9 - January 19, 1990 - Part 4 of 4

RESTRUCTURING OF THE PACKET BULLETIN BOARD SYSTEM PROPOSED
(continued from preceeding message)

Another control which is needed is the ability to flag a given newsgroup as "moderated." In such cases, users would not be allowed to post articles directly to that newsgroup. Instead, they would get a message giving them the name and e-mail address of the moderator for that group and be allowed to mail the article to the moderator if they wish to continue.

For reading the news, the PBBS user interface should provide some of the functions of the USENET newsreaders. The most important function is the ability to allow users to select which newsgroups they want to see. The selection, along with other preferences, would then be part of the user profile stored in the user file. There would be at least one obligatory newsgroup for important local announcements, which cannot be unsubscribed. The news should be kept entirely separate from mail, the two areas being entered with different commands.

In general, the user interface should not only make it easier to selectively find and read news items, but also to interact with them by facilitating the process of responding to them. For instance, the PBBS Send commands should be supplemented with a Follow-up command which would accept as an argument, a message number. It would create a new news article having the same newsgroup, distribution, and subject (prefixed by "Re:" if it isn't already) and the user just has to enter the text. Some means of tracking message threads would be handy too (or at least a command to list articles having the same subject as a particular article). One of the reasons I don't like the term "bulletin" is that it implies a one-way flow of news. I want to see more interactive discussions taking place by means of the PBBS network and software which facilitates such interaction.

There are many possibilities for enhancing the news reading interface, but the important thing right now is to start the evolutionary process in the right direction. Start using the To: field categories which have been suggested, along with others that appear as needed. After this usage has become well entrenched, we can try to standardize a basic set of newsgroups, a method for adding new ones and discuss how the newsgroup name field might best be extended. At the same time, we should only use the @PBBS field for geographical distribution areas. Then the PBBS software writers can have at it and create some of the new tools we need to make the news distribution system work the way it should.

The PBBS network provides a very useful e-mail service for its users, but the bulletin distribution system is degenerating into chaos. We have an opportunity to build it into a truly useful system for distributing and exchanging information, but we must act now. Let's get on with the job!

Comments are welcome.

Brian is quite correct. The DOVE-1 does NOT listen to 145.825. It will never be a packet radio digipeater or any of that stuff. In the VERY NEXT upload, messages will be sent which tell the poor folks who are suffering from our lack of pre-flight publicity, that 145.825 Mhz is in the Amateur Space allocation and that this is an educational satellite. It is just so loud people don't realize that it is a satellite. Hell,

it is louder than most of the digi's I connect to around here.

677. EMS Radio Service

Newsgroup: rec.ham-radio
Date: 1990-01-30 13:38:23 UTC
From: Jim.Grubs@f218.n260.z1.fidonet.org
Message-ID: <11635.25C59A10@stjhmc.fidonet.org>
Source record: 13729

* Forwarded from "FCC"
* Originally from David Stark
* Originally dated 27 Jan 90 0:09:00

I would like to propose the following amendment to Part 90 and am interested in comments from potentially affected parties:

To amend Part 90 creating a new "Emergency Medical Radio Service". This service would differ from the current "Special Emergency Radio Service", in which most ambulance services are licensed now, in that it would be an exclusive allocation for use only by those organizations whose primary mission is providing emergency care and transportation of the sick and injured.

At the present time, spectrum for new users is scarce in populated areas. Existing channels are shared with school buses (ever hear the CB-like chatter from them?), veterinarians, hospital security departments (some use up enough air time for a small police department), ski patrols and even handicapped individuals (why?).

While many Public Safety agencies are making or planning moves to newly opened 800 MHz spectrum, in many areas such a move is not desirable. Existing communication systems and area bandplans can make it preferable to stay on VHF-High Band or UHF. Moving some incompatible services to 800 MHz would just transplant an existing interoperability problem to a new frequency range.

Since it appears that some spectrum is being deallocated from the Federal Government's exclusive use, I propose using some of it for this "new" service. While it was not technically feasible in years past, new radio equipment has sufficient bandwidth to use new frequencies in the 138 to 144 MHz or 162 to 174 MHz bands as well as existing EMS channels in the 155 MHz band.

I would be very interested in comments and suggestions from other persons in the EMS field that might be affected by this idea. I am also interested in informed comments from FCC-type people on how likely a Rulemaking Petition would be to have any success.

678. Re: SCA - Not as easy as it seems

Newsgroup: rec.ham-radio
Date: 1990-01-30 14:02:21 UTC
From: rfc@briar.philips.com
Message-ID: <77176@philabs.Philips.Com>
Source record: 13727
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Many years ago, I built the SCA demodulator with the 565 chip. It did work. What you need to do is get the signal before it is de-emphasized at the main FM demodulator. This is fairly easy to do in an all discrete FM radio, but may be non-obvious in a chip design. Anyway, the problems I've had with SCA demodulators is the main program signal leaking into the demodulated SCA program. I've tried 67KHz filters, etc, which helped some, but I still had interference. Probably the bandwidth of the IF strip has an effect. Sometimes, at hamfests, someone might have SCA radios to sell. Usually surplus from store paging systems, blind radios, doctor network radios, etc. These also suffer some from the above interference problem, so it may not be a fixable thing. Though a good antenna helps here. Like directional, pointing at the station (to avoid multipath?).

73 de WA2ISE

I also did a SCA demodulator with a CA3089 (?) FM IF and demod chip. This worked better than the 565.

679. Re: Voice Mail Box For Repeaters ?

Newsgroup: rec.ham-radio
Date: 1990-01-30 14:10:30 UTC
From: rfc@briar.philips.com
Message-ID: <77177@philabs.Philips.Com>
Source record: 13728

A feature of a voice mail box in a repeater that might be of some use would be a delayed (by on the order of a minute) playback of someone testing his FM rig. Enter a special code via touch-tone to activate this. That way, you would be more confident that your rig is modulating w/o distorting, etc. Limit this feature to non-prime time hours, though.

An engineer I once worked with told me that the tunnels near the Presidio (military base in San Francisco) had these wires installed during WW2 so the base commander (or whatever the military title is) could stay in contact via two-way radio while driving around. I believe that the tunnel wires originally had a tuned external antenna feeding the wire. You can see what looks suspiciously like a diplole cut for the middle of the FM broadcast band on the outside face of some tunnels. It probably works as an untuned antenna for the AM band.

From: alanb@hpnmdla.HP.COM
Message-ID: <1250118@hpnmdla.HP.COM>
Source record: 13754

Seems to me that this whole discussion on good earth grounds is
kind of moot. Even if you get a .001 ohm ground connection, you still
have to connect it to the radio with a wire. On 10 meters, anything
over 3 or 4 feet will almost certainly have more impedance than
the ground itself.

Earth grounds are for lightning protection, not RF ground.

To get an RF ground, use a 1/4 wave counterpoise wire, one for each
band, attached directly to the point you want "grounded".

PACSAT DOVE and LUSAT CW decoding software is available from AMSAT
via me, Joe Holman KA7LDN.

I've written software to decode LUSAT's CW beacon; and, i will be
performing additional work to N4HY's PACSAT decoding software
for the PACSATs (including DOVE).

To get the stuff:

o Send a SASE 5 1/4 diskette mailer to:

Joe Holman, KA7LDN
22909 NE 24th Pl.
Redmond, WA 98053

o or, send a $5 check donation (or more!) to AMSAT
at the above address, to cover diskette
and mailer if you can't provide...

684. Modifying Radio Shack Weatheradios for Dove Reception

Newsgroup: rec.ham-radio
Date: 1990-01-30 17:51:10 UTC
From: LANG@UNB.CA
Message-ID: <ID6021.D900130.T135110.LANG@UNB.CA>
Source record: 13742

Is it feasible to modify Radio Shack Weatheradios (e.g. 12-115) for
Dove reception? Is more than a crystal change and re-tuning
necessary? This might be an economical way to get high school students
(and others) interested in the amateur satellite program.
The 12-115 was $21.95 in the 89 U.S. catalogue; currently $29.95 in
Canada. I vaguely remember a QST article sometime back on converting
Weatheradio Cubes for 2m (now lost in my "archives" somewhere!)

>
Back in the old days, when we had not heard of Yuppies, and
german cars were all called "beetles", most long tunnels had
emergency telephones so that if there was a breakdown or fire,
someone could call for help. Maybe, rather than reach for the
cellular, the yuppies can join the peasants and walk to a phone
booth.

But apart from that, I would assume that the short wavelength of
cellular (ca 37 cm) would penetrate farther down tunnels than FN
Broadcast (3 M).

About 10-15 years ago Wireless World ran a good series of
articles on propagation in tunnels and mines. They covered,
wavelength considerations, leaky coax and wires with antennas
above ground. Plus as I recall, selectively unbalanced balanced
feeders.

All of the above maybe should have been read by the London Fire
brigade who had radio problems when fighting an underground fire
in the London subway (Kings Cross). Note that in High Rise
buildings in the US, the fire brigade have prewired telephones.
Look for 1/4 ins jacks near elevators etc. Seems that they trust
a simple phone system more in concrete buildings.

Yours

> I am looking for AMSAT tracing software for a PC-XT.
>

You can `roll your own' from the early programs printed in Orbit magazine,
in basic, which is available on most PBBS's around the country. It is
rudimentary but does the actual job you want which is to track the satellites.
If you want fancy graphics, scheduling algorithms of many varieties,
star maps showing the satellite against the background, and other real
goodies, these are available from AMSAT for a fee. They have Quiktrak
(written by me) for a multitude of computers, and Instanttrack 1.0 for
the PC. Both of these programs are good tracking software packages.
Instanttrack is probably the fancier of the two for the IBM PC <<BUT>>
it does require EGA or better. It is a nice piece of work.

> a good supply of free ions in the water around the ground.
Lotsa good stuff deleted above.

Oh, boy have we opened a can of worms here. Well I know copper sulphate is toxic to algae, and is used to clear alga from some water systems. And yes, Nitrate fertilizer causes algal blooms in water. It is also considered harmful in drinking water above certain concentrations, as is salt. So that leaves us with ferrous sulphate which is probably less toxic but makes drinking water taste bad. Then there is Epsom salts (magnesium Sulphate), so called because they are the chemical that contaminates the spa water in Epsom, Surrey, England. Epsom salts taste foul and give you the runs.

All looks pretty grim whatever we use.

One final suggestion: Use Nitrate fertilizer until the local water turns green, then use Copper Sulphate until, it clears up. -:) Or, use Ferrous and Magnesium Sulphate until you can't stand the taste and are tired of having the runs. -:)

Perhaps we should just leave it alone. Maybe moderation is what is called for.

>
>
> 73,
> 4X1DA @4XNET
>

Richard:

Wow, the rumor mill is world wide. I am a perfectionist. Until the thing is near perfect, I am just going to keep working on it. The latest problem is a noise source that gets into the AGC circuit. There is always a fine balance between perfection and cost and I am turning over the best product I can. It will not be cheap but it will be a work horse and it is expandable in that the modems are DSP. Brooks, KB2CST, Pat KA2MOV, and I are DSS, the designers of the box. We are targetting Dayton, parts are being ordered by AEA to do the first run and we are keeping our fingers crossed that it will in fact be ready in time for Dayton. I make no promises that I can't keep. This is the reason there is NO delivery date in our contract with AEA.

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

I have a Cobra cordless pulse dialer. The O.M. has the following:

Channel # Handset TX Freq Base TX Freq

1A 49.83Mhz 1.69Mhz
7A 49.845Mhz 1.71Mhz
13A 49.860Mhz 1.73Mhz
19A 49.875Mhz 1.75Mhz
25A 49.890Mhz 1.77Mhz

Keep in mind that its using 49Mhz from the handset to the base
and 1Mhz from the base to the handset.

You may also find more by scanning from 49.8 to 49.9 and 1.6 to 1.8Mhz.

>
> 3. Anyone have the service manual for this one yet?

I have heard that with mods, the 24AT will cover something like 70-900 MHz,
including switching to AM when in the air band. I suspect the receiver is
closely related to the RZ-1 (or whatever the new handheld is, 150KHz-1300MHz).
And I believe the 24AT comes configured to do crossband full duplex.

I'll know more when I get mine :-) It's on order and should be here in
the next week or so. I expect to get the mods also. I'll post them if
they work.

695. Re: Voice Mail Box For Repeaters ?

Newsgroup: rec.ham-radio
Date: 1990-01-31 00:03:45 UTC
From: cep4478@ultb.isc.rit.edu
Message-ID: <2056@ultb.isc.rit.edu>
Source record: 13763

I have been working on this project for K2GXT/R for some time.
What I came up with as the best hardware solution is made by
a Canadian company, called "Computer Age Limited."

Computer Age Ltd. makes a board that digitizes at 8KHz which
only costs $99 US, which runs on an IBM P.C. They suggest
using it with a 4KHz sampling rate (not very good, but 8K is
more than enough) for 170 minutes on 20MB hard disk.

The card utilizes one hardware interrupt and one DMA channel.
It works better on an XT than on an AT, so I'd suggest getting
a (cheaper) AT.

Writing software for it is a dream, it's so easy...can be done
in C quite nicely. (It even could be done in BASIC, though
I'd be embarassed to put a repeater up in BASIC) (no smiley)

The address for Computer Age Limited is:

P.O. Box 730
Nobleton, Ontario L0G 1N0
CANADA

As soon as I finish this project, I'm going to send it to either
QST or 73 magazine -- Frankly, I like the RC-850 a lot and I
think it's a neat controller, but if I were putting up a repeater
there's no way I'd do it on anything other than an XT. I find
this ESPECIALLY true when it comes to voice mail - what many
commercially-bought repeaters call "voice mail" is a pre-programmed
set of ten or so computer-generated messages. ex you punch tone 20
for the message "Call me tonite" -- neat, but you can get an XT
up w/ a 20MB hard drive for little money these days (even when
you include an NEC V20 microprocessor upgrade and RLL controller).

Let me know how you make out and best 73's,

Chris, N2JGW

Hello, world! (K&R)

I finally built an electronic keyer...now, all I need is
a paddle for it :-)

I have been thinking about trying touch-sensitive, like the
Heathkit keyer uses - touch-sensitive FIXED paddles. Does anybody
know a good circuit to accomplish this? I am told that there is a
good design using an LM2917 but I couldn't find it anywhere (and the
LM2917 is in a databook which I don't have).

I think I could get used to the lack of tactile feedback
associated with fixed paddles - I usually adjust the ordinary kind
very close to contact, anyhow. Has anybody out there used the Heath
set before, and if so, any thoughts? Any ideas on how to BUILD one?

(Must admit ... one major part of the appear here is *CHEAP*)

My understanding is that both PocketQuote and Lotus Signal supply
both delayed and real time data in the data stream under different keys, with
a higher price charged for the real time version of course.

PocketQuote also includes Dow Jones News, also for an additional fee.

There are some exchange rules regarding the uses that real time
streams can be put to, and I think users have to sign an agreement
stating that they won't violate those rules before they can get the
real time feed.

>all kinds of SCA transmissions but the universal feature they all had
>was a fairly high S/N ratio. The carriers are transmitted at very low
>modulation levels compared to the program audio (someone will
>enlighten us with the exact percentage, no doubt).

Couple of points:

1. I beleive that only 1% or so of the power of an FM station
is allowed to go into the SCA sidebands (I don't have the rules handy
so that is from memory).

2. Most SCA signals carrying audio programs rather than FSK or
PSK or VSB AM data are compandored with 2:1 or 3:1 compression ratios.
This means that a proper receiver should incorperate an expander
(a la DBX). This will get rid of most of the background noise in
quiet passages.

3. The best simple SCA demodulator circuit I've run across uses
a multi-pole LC linear phase bandpass filter ahead of a CA3089 limiter/
quadrature demod. It works lots better than 565 Plls with no selectivty
ahead of the phase detector.

4. SCA performance is a function of IF bandpass filter quality
amoung other things. Filters that have poor group delay linearity
actually modulate the SCA carrier with the main channel audio. The
effect is main channel bleed into the SCA. Real SCA tuners (which show up from
time to time around here at flea markets) seem to use much better
IF filters than regular hifi tuners (although best stereo separation
and distortion requires good IF characteristics).

5. As is the case with any FM system, the higher frequency components
of the signal see more FM noise at a given CNR, so signals which quiet
pretty well on the main channel are not guaranteed to produce good
results on SCA. Good antennas help.

CC: pkarn, rsoifer
Subj: New object info

Good evening all.

I received a phone call late Tuesday afternoon from Max White at RGO. He has forwarded a late set of elements to me and I will post them as soon as they arrive via Email--hopefully sometime tonight. However, Max informs me that the "boys under the dome" have definitely identified the B object as being the Ariane final stage and the H object as a Uosat. However, the report is that H is Uosat D or UO14--This is almost certainly incorrect. There is no reason to believe that H is a TRANSMITTING object. It therefore follows that H must be UO15 or Uosat E. Observations by Phil Karn and Ray Soifer indicate that both B and H are non-transmitting and Max assures me that B is the launcher based on Radar x sections.

The severe weather in the UK is probably behind the delays in email coming across, so bear with us--flooding/line outages etc. It may very well appear via Surrey on tmail before I can get it here.

SB ALL @ AMSAT $ANS-029.01
AMSAT'S BUSIEST WEEK, PART 1

HR AMSAT NEWS SERVICE BULLETIN 029.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

This week has been the busiest in AMSAT history. It started on Sunday evening when ESA launched six amateur radio satellites on an Ariane IV launch vehicle. After successfully separating each of the new OSCARs (14 through 19) from the launch vehicle, the AMSAT engineering team successfully commanded ON the telemetry beacons on LUSAT, PACSAT, and WEBERSAT. The DOVE satellite turned itself on (each of the microsats are running software that will turn on the transmitter when the on-board battery voltage exceeds a specified value). AMSAT-UK commanded ON the beacons of the two UOSATs during their fourth orbit.

Through out the week, the AMSAT engineering team has been busy transmitting commands to the satellites and decoding telemetry to determine the status of each. All of the various functions and experiments on each satellite must be exercised prior to commissioning the birds for general use. Other members of the engineering team have been attempting to characterize the orbit of each of the birds by evaluating AOS (Acquisition of Signal), TCA (Time of Closest Approach), and LOS (Loss of Signal) along with Doppler shift variations. Because the OSCARs do not carry RADAR transponders, it will be a week or two before NASA and NORAD can accurately identify each of the objects.

Bob McGwier N4HY and Harold Price NK6K are taking lead roles in commanding the microsats and analyzing the telemetric data provided by each bird. The amount of work to accomplish over the next few weeks is nothing short of staggering. Caring for a new satellite during the early part of its life span is very analogous to caring for a new baby, and in this case Bob and Harold have got to care for quadruplets. Rumor has it that they are not getting much sleep!

/EX
SB ALL @ AMSAT $ANS-029.02
AMSAT'S BUSIEST WEEK, PART 2

HR AMSAT NEWS SERVICE BULLETIN 029.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990

TO ALL RADIO AMATEURS BT

Although their transmitters run only 0.5 - 4 watts, each of the satellites has an extremely strong signal that is easily received using an HT with a rubber duck antenna. The telemetry on each of the microsats is in 'packetized' form (AX.25). PACSAT, LUSAT and WEBERSAT are using a PSK modulation technique transmitting above 437 MHz and DOVE, transmitting on 145.825 MHz, is using an AFSK modulation technique identical to standard amateur TNCs. Initial check-out of the S-Band (2401 MHz) packet beacon on PACSAT shows it to be operating nominally and the 100+ KHz of Doppler shift makes for an interesting decoding challenge.

Over the next few weeks it will be critical that accurate records of satellite telemetry be recorded. Bob McGwier has requested that interested amateurs "... continue to gather and store telemetry for the next couple of weeks minimum while we learn (how) to control these birds and how they like their new home. An announcement will be made shortly concerning a collation and archiving center for this data.

Finally, the AMSAT engineering team requests in the strongest possible terms "DO NOT ATTEMPT TO TRANSMIT TO ANY OF THE NEW SATELLITES" They have not been commissioned for general use and unauthorized transmission to the satellites could cause serious harm to its operation while interrupting important testing of each bird. By letting the engineering team do their job without interference, they will be able to deliver healthy satellites to the amateur community that much sooner.

SB ALL @ AMSAT $ANS-029.03
UPDATE ON UO-14 AND UO-15

HR AMSAT NEWS SERVICE BULLETIN 029.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

The two UOSATs were successfully commanded ON during the first day from the University of Surrey, where they were designed and constructed. Later in that day, the on-board computer operating system (DIARY) - 17 k-bytes of computer code - was uploaded to both satellites. One of the important features of the DIARY is its ability to store telemetry data during one or more orbits and to relay this data to the ground station. This technique was first used on UoSAT-OSCAR-9, and dubbed "Whole Orbit Data" or WOD. The next step in the commissioning of UO-14 is to deploy the navigation magnetometer and gravity gradient boom. After this has been accomplished, software to attain Earth-pointing lock will be executed. These maneuvers should be undertaken during the next 10-14 days, if all goes well.

UO-15 was also loaded with the FORTH DIARY on the 2025 UTC pass on 22 JAN 90. The DIARY executed as expected, telemetry values were nominal, and a WOD survey was started during the 2206 UTC pass. Telemetry from the DIARY was automatically recorded at the UoSAT Control Station during the 2330 UTC pass, and no unexpected values were observed. During the 1010 pass on 23 JAN 90

(approximately 25 hours after the satellite was initially commanded to life) no downlink was received at Surrey from UoSAT-OSCAR-15. Since that time, there have been no signals that could be attributed to UO-15 received by the University of Surrey. Anyone who copied UO-15 telemetry during 22/23 JAN is requested to contact AMSAT-UK in Surrey, or AMSAT-NA so that the telemetry can be studied to determine the cessation of transmission from UO-15.

SB ALL @ AMSAT $ANS-029.04
THE "OUTSIDE" WORLD WATCHES THE LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 029.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

There has been a fair amount of media coverage of the launch of the Ariane IV V-35 mission including specific coverage of the amateur satellites. CNN Headline News had a story within 30 minutes of the launch and subsequent reports went into some detail about the Microsats. German ARD Television had an interview with Junior DeCastro PY2BJO about DOVE. Leo RA3AT reported that the Soviet news agency TASS, Central Radio and TV also carried a story on the launch and specifically mentioned the amateur radio satellites. Space News and InfoWorld have apparently written articles on the launch to be published soon.

To show the extent to which "outsiders" have shown interest in the launch of the the six satellites, consider the following story from Chris Williams, WA3PSD:

Faculty and students at Weber State College have provided a significant amount of time and materials toward the Microsat program as well as the upcoming Phase IV program. It was announced this week that the State of Utah's Board of Regents voted against the heated objections of the University of Utah and Utah State University to change the status of Weber State College. The matter had been under consideration for some time. The school will henceforth be called Weber State University. The successful launch of Webersat was called "significant" as an influence on the decision.

APPOINTMENT OF DIGITAL GATEWAY COORDINATOR

HR AMSAT NEWS SERVICE BULLETIN 029.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

AMSAT Vice President for Operations, Courtney Duncan, N5BF, announces the appointment of Harry Morton III, WB2IBO, AMSAT-NA Technical Coordinator for Digital Gateways. Harry will be close to developments in packet message forwarding via the recently launched pacsats. He will be the AMSAT point of contact for those wishing to participate by 1) configuring packet bulletin boards for pacsat access and automatic pacsat forwarding, 2) establishing

pacsat relays for use by terrestrial packet bulletin boards, or 3) establishing pacsat relays for use by terrestrial end users who do not have their own satellite capability.

Harry is now establishing a mailing list consisting of those who intend to set up such stations. He will be operating a pacsat node himself and will be available for consultation with those who wish to put other nodes on the air and maintain them for reliable amateur radio satellite access. He may be contacted at 261 N. Chestnut Street, North Massapequa, New York, 11758 for additional information.

SB ALL @ AMSAT $ANS-029.06
MICROSAT NAMING CONVENTION CLARIFIED

HR AMSAT NEWS SERVICE BULLETIN 029.06 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

In recent weeks there has been some confusion as to the on-orbit designators for the four Microsats launched January 22. AMSAT-NA President and General Manager Doug Loughmiller, KO5I, has reviewed relevant agreements and other AMSAT-NA documents and has determined that the following designators are to be used:

PACSAT AMSAT-OSCAR-16 AO-16
DOVE DOVE-OSCAR-17 DO-17
WEBERSAT WEBERSAT-OSCAR-18 WO-18
LUSAT LUSAT-OSCAR-19 LO-19

Each of the Microsats except PACSAT was built by AMSAT-NA engineers for and in cooperation with amateurs from other organizations: BRAMSAT (AMSAT-Brazil); Weber State University, Ogden, Utah; and AMSAT-Argentina respectively. Each of the projects has been governed by its own "Memorandum Of Understanding." These MOUs specify the names to be given to the satellites before and after placement in orbit and other relevant technical and administrative details.

The AMSAT News Service regrets any confusion that may have been caused through previous errors in the use of satellite designators.

Courtney Duncan, N5BF, AMSAT VP Operations

KUDOS FOR AMSAT MICROSATS, PART 1

HR AMSAT NEWS SERVICE BULLETIN 030.07 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

Congratulatory Messages Pour In For The New OSCARs

Almost immediately after the launch of the AMSAT MICROSATs on January 21, 1990, messages of congratulations and praise started to pour in from around

the world. Here are brief summaries of the messages received at AMSAT Headquarters:

ARRL: "Congratulations to AMSAT for the successful orbiting of four MICROSATs. What the AMSAT team has done reflects credit on the entire Amateur Radio community ... As a engineering project, it was nothing short of spectacular ... AMSAT can justifiably take pride in providing the Amateur Radio community with a new communications capability. The ARRL shares in your pride and is pleased to have had the opportunity of contributing to the project." K1ZZ

PROJECT OSCAR: "Congratulations to everyone for a job well done adding the MICROSATs to the Amateur Radio Space program. Everyone here at Project OSCAR is pleased to see the progress being made by the latest addition to the OSCAR line!" WB6GFJ

AMSAT-DL: "We congratulate all team members of MICROSAT and UoSAT for the successful launch and the great work they all have done -- well done!" DB2OS

"AMSAT-DL congratulates UoSAT, AMSAT-NA, and all participants to the successful launch and opening of all MICROSATs and UoSats. Our best wishes for the future operations and may the new satellites have a long life." DJ4ZC & DJ5KQ

KUDOS FOR AMSAT MICROSATS, PART 2

HR AMSAT NEWS SERVICE BULLETIN 030.08 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 30, 1990
TO ALL RADIO AMATEURS BT

AMSAT-UA: "I and all AMSAT-U people congratulate MICROSAT Team on successful launch of the 4 MICROSATs. Soviet news agency TASS, Central Radio and TV first reported about launch of six satellites for radio amateur application ... Best regards to all my friends." RA3AT

AMSAT-I: "WOW! We made it! Best congratulations to all of you guys for the new birds which will soon be chirping!" I2KBD & IW2ECL

JARRL: "Congratulations for the successful launch of MICROSAT and UoSAT to all you made this happen ... This is great." JA2PKI

VITA: "What a superb job everybody did ... the launch was flawless and for me personally quite an experience as it was the first time. Congrats to AMSAT for hanging in there. It was truly an inspirational moment." Gary Garriott

DRIG: "The members of the Dallas Remote Imaging Group, and the local Dallas AMSAT group congratulate the entire team for an outstanding effort." N5ITU

AMSAT-SA: "Congratulations to all! The launch of the 6 satellites is another triumph for Amateur Radio." ZS6AKV

The Board of Directors of the ARRL proclaim: "... Therefore be it resolved, that in recognition of the contribution of the amateur satellite program to the

Amateur Radio service and the significant events which are to occur during the course of the year 1990 within this discipline of amateur radio, we hereby declare: 1990 THE YEAR OF THE AMATEUR RADIO SATELLITE PROGRAM"

Subj: UOSAT-OSCAR-14 SOURCE CODE FOR TLM

/*---------------------------------------------------------------------------
Author: JW Ward, G0/K8KA
Date : 30/1/90
Action : This simple program reads UoSAT-OSCAR-14 telemetry from a
file and displays each channel with its raw value. It is
provided as an example of how to decode the FORTH Diary
frames.

A full UoSAT-OSCAR-14 telemetry display program
will be available from AMSAT-UK.

The input to this program must be a BINARY log file, with
all binary bytes preserved. Watch out: Procomm seems to
not log zeros!

The program compiles and runs with Microsoft C 5.0
---------------------------------------------------------------------------*/
#include <stdio.h>
#include <stdlib.h>

#define SYN0 0x45
#define SYN1 0x34

/*---------------------------------------------------------------------------
Funct : process
Date : 30/1/90
Action : A simple display routine for the demo telemetry program.
RETURNS : Nothing.
GLOBALS : None.
---------------------------------------------------------------------------*/
void process(int chan, int value)
{
/* channels 0-48 are valid analog channels */
if (chan < 49)
printf("Channel %02d = %03d\n", chan, value);

/* channels 64 through 72 contain the valid digital status points */
/* As a further note on the status points: they are numbered from */
/* 0 to 71, with status bit 0 being the most significant bit of */
/* channel 64, and status bit 11 being the least significant bit */
/* of channel 64. Status bit 12 is the MSB of channel 65, and so */
```

```
/* on. */
else if ((chan >= 64) && (chan < 73) )

Subj: UoSAT BINARY FORMATS

UoSAT-3 and 4 FORTH Diary Binary Data Formats

Beware: Some changes to this packet format are likely. The first change will be the addition of a timestamp to each packet. This will be 5 bytes between the ID byte and the Frame Number.

1.0 General Packet Format

The various types of data available from the FORTH Diary operating on UoSAT-3 and 4 can be sent to the downlink using packets made up from asynchronous bytes. The basic packet format is the same for all types of data, with an identification byte used to differentiate different types of data. Currently, the data is transmitted at 1200 baud, with 8 data bits, no parity and 2 stop bits.

Each packet is made up of 71 bytes, as shown below.

Bytes	Function
1	Sync1
2	Sync2
3	ID Byte
4	Frame Number MSB
5	Frame Number LSB
6	Data0

7	Data1
.	
.	
.	
68	Data62
69	Data63
70	Checksum MSB
71	Checksum LSB

Detailed Description

2.0 Sync Bytes

The Sync bytes used for each version of the FORTH Diary are shown below

---
| Version | Uo-2 | Uo-3 | Uo-4 |

| Sync 1 | 50h | 45h | 55h |
| Sync 2 | 41h | 34h | 38h |

2.1 ID Bytes

The ID byte is used to indicate what type of data is contained in the packet. The following values are currently defined.

| ID Byte | Type of Data | No. of Frames |

0	Binary Whole Orbit Data	352
1	Engineering Data	1
2	Binary RAM dump	Variable
3	Telemetry	3
4	Solar Cell Expt. Data	64

2.2 Frame Number

The frame number is a 16 bit value, transmitted as 2 bytes, most-significant byte (MSB) first. The maximum frame number sent is dependent on the type of data being transmitted. The number of frames for each type of data is shown in the table above. For example, when telemetry is transmitted frame numbers 0,1 and 2 are repeated continuously. WOD dumps take more than 300 frames.

2.3 Checksum

The checksum is the 16 bit addition of the all bytes in the packet, excluding the sync bytes. With one exception, each byte is treated as an integer, and added to a 16-bit accumulating value. Overflow of this accumulator is ignored. The value of the accumulator after the reception of data byte 63

should be equal to the received checksum.

The exception to the above simple addition is the Frame Number. The two bytes of the Frame Number are treated as a 16-bit value and added to the accumulator register. For example, upon receiving a frame with ID Byte 0, Frame Number 1234 (hex) and all 0 data bytes, the checksum should be 1234 (hex), and NOT 12+34=46 (hex).

2.4 Data Bytes

The data bytes when stored contiguously provide a copy of the spacecraft data buffer being dumped. The format of actual information within this buffer depends on the type of data being dumped.

2.4.1 Binary Whole Orbit Data

Whole orbit data is made up of telemetry samples from a relatively small number of channels stored sequentially in the buffer. The number of channels being surveyed is adjustable between 1 and 10 channels. The Engineering Frame tells which channels are contained in the survey (see Section 2.4.2).

Each telemetry sample is 12 bits wide, made up of three BCD digits for analogue channels and 12 bits for status channels. These are packed tightly into memory with 2 channel samples in every 3 memory bytes. For example a 3 channel survey is packed as follows:-

Byte 0 1 3 4 5 6 7 8 9
|H1M1|L1H2|M2L2|H3M3|L3H1|M1L1|H2M2|L2H3|M3L3| etc.

|------ Sample 1 -----||------ Sample 2 -----|

where H1 is the High Order Digit of the 1st sampled channel
M1 is the Middle Digit of the 1st sampled channel
L1 is the Low Order Digit of the 1st sampled channel
H2 is the High Order Digit of the 2nd sampled channel etc.

H1 is stored in the most-significant nibble of byte 0.

2.4.2 Engineering Frame

The engineering frame contains 64 bytes of FORTH system variables. These include many of those which are transmitted in the normal status messages. The first 32 bytes of the frame are defined below. The second 32 bytes contain variable associated with the attitude control system and liable to frequent alteration as the code is refined.

Byte Function

0 Clock Seconds (BCD)
1 Clock Minutes (BCD)
2 Clock Hours (BCD)
3 Day of month (BCD)
4 Month
5 Day of Week (1=Sunday)
6 0

7 0
8 0
9 WOD Start time seconds (BCD)
10 WOD Start time minutes (BCD)
11 WOD Start time hours (BCD)
12 WOD Start time day (BCD)
13 WOD Start time month (BCD)
14 Diary mode (1=manual, 0=auto)
15 Last command number
16 Last command sense
17 Last command data
18 Attitude Control state (1=enable)
19 Attitude Control Mode
20 WOD collect in progress (1=true)
21 WOD number of channels
22 WOD Channel position 1
23 WOD Channel position 2
24 WOD Channel position 3
25 WOD Channel position 4
26 WOD Channel position 5
27 WOD Channel position 6
28 WOD Channel position 7
29 WOD Channel position 8
30 WOD Channel position 9
31 WOD Channel position 10

2.4.3 Binary RAM Dump

This format is a direct dump of any part of the 1802 memory and is used for diagnostic purposes. The data is dumped in 64 byte blocks from the specified starting address up to the specified finish address.

2.4.4 TELEMETRY

In this mode each frame contains 32 telemetry channels, with each channel occupies 2 bytes. The 1st byte of each channel contains the most-significant 4 bits of the telemetry value, and the 2nd byte contains the remaining 8 bits. For analog channels each 4 bits is a BCD digit. For digital status points, each bit represents one status point.

The Frame Number tells which channels are contained in the frame. Frame Number 0 contains channels 0 to 31, Frame 1 has channels 32-63 and Frame 2 has channels 64-80. The remaining 16 bytes in Frame 2 do not contain valid data.

For example the beginning Frame 0 is as follows:-

Byte 0 1 3 4 5 6 7 8 9 10
|00H0|M0L0|00H1|M1L1|00H2|M2L2|00H3|M3L3|00H4|M4L4| etc.

|--Ch.0---|--Ch.1---|--Ch.2---|--Ch.3---|--Ch.4---|

where H0 is the High Order Digit of Channel 0
M0 is the Middle Digit of Channel 0

L0 is the Low Order Digit of Channel 0
H1 is the High Order Digit of Channel 1

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #005 1300 UTC 30 January 1990

** UoSAT-OSCAR-14 **

On 29 January, in aid of efforts by KA9Q, W2RS, and others to identify conclusively the orbits of the OSCARs-14 through -19, we monitored "sunrise" at UO-14. The sunrise time was 18:57:41 UTC, measured using the onboard hardware telemetry system; this time may be a bit later than the actual sunrise, as the telemetry system takes 3 seconds to sample all channels. We monitored the solar array voltage, which is the first telemetry point to respond to sunlight. The measured time corresponds closely with the "object D" in current Keplerian element sets.

On 26 January, the OBC collected a WOD survey of the magnetometer channels. Before describing this survey, we must review the satellite axis system: the Z axis is the long axis of the satellite, which will eventually point toward the earth; the X and Y axes are the axes through the satellites solar panels.

Qualitatively, the WOD survey shows that the Z axis and the Y axis are measuring the same magnetic fields. The Y axis shows a decidedly different pattern, with two magnetic maxima per orbit. After some analysis, this is interpreted as follows:

1) UO-14 is not spinning about the Z (long) axis.

2) It is, spinning about the Y axis, which is called a 'flat spin'.

3) This flat spin has inertially stabilised the satellite in a plane parallel to the Earth's equatorial plane, i.e. with the Y axis pointing north-south.

To visualise this, take a shoe box and place it on a table. The Y axis passes through the top of the box. Stick a pencil through this. The X axis is through the sides, and the Z axis through the ends. The satellite is spinning around on the pencil, the Y axis. As the satellite orbits, this axis

remains pointing north-south.

This analysis can be confirmed by watching the solar panel currents when UO-14 is in sunlight. As it spins about the Y axis, the sun strikes the +X panel, an end of the satellite, the -X panel, the other end of the satellite. The Y panels get very little illumination. This also keeps the X panels warmer than the Y panels.

This inertial stabilisation is not having any ill effects on UO-14, though internal temperatures are somewhat lower than final operating temperatures. The next step in acquisition of gravity-gradient lock is to break the flat spin, and line the satellite up with the Earth's magnetic field. This requires active magnetorquing under control of the 1802 OBC.

** UoSAT-OSCAR-15 **

We are attempting to determine what has kept UO-15 silent for the past week. Most subsystems on the satellite have redundant backups, and so this silence is puzzling. Many simple failure scenarios (e.g. that there is an uplink problem similar to that experienced on UO-11), are not likely, since the Z-80 OBC should still be commanding the UO-15 beacon on and off even if we are not getting commands in from the ground. The UO-14/15 command system processes all commands from all sources "simultaneously", so a runaway OBC could not be blocking ground commands. We are trying all possible command sequences.

We still urgently need any reception reports from 435.120 MHz after 2300 on 23 January.

- de G0/K8KA.

Subj: Microsat software development

Some of you might be wondering what we're doing with the microsats, and why you can't connect up yet.

The development cycle for these launches was very short. Most of the time available for software development, beyond getting the basic operating system and I/O drivers running, was in writing support code for ground-based hardware checkout. A fully operational CPU wasn't mated to a fully operational spacecraft until very late in the game. Much of the available software time after that went into qualifying the rom-based bootloader. Given the short time available, the goals were :

1) Check out all of the hardware on the ground.
2) Have the best chance possible of getting good telemetry as soon as possible once the spacecraft reached orbit.

This resulted in a limited-feature, but very reliable set of launch support software. This is the software that was running when the transmitter on commands were sent.

Once the spacecraft were in orbit, several shortcomings in the high-level software loader and in the battery management routines were seen. Bob and I have been working to fix these, in addition to commissioning groundstations which have never talked to microsats before, and spacecraft which have never talked to the ground before, times 4.

Once procedures are worked out, they are documented so that new command stations can be brought on line.

Here is a typical day in the life of Bob and Harold. Each day has been like this since launch. Times approximate.

12:00-16:00 UTC
Bob wakeup, read mail from Harold for previous night's passes. Copy early passes, check action of software loaded last night. Reconfigure s/c as required. Finish testing new command and control software for next spacecraft. Send to Harold.

15:00-18:00 UTC
Harold wakeup, read mail from Bob, get new command and

control software from bob. Integrate with new loader code, test on spacecraft CPU simulator.

18:00-20:00 UTC
Harold to TRW. Start upload of new software to spacecraft. This is a bit tricky, which is why a new loader is being sent. TRW ARC crew tapes or copies other spacecraft in realtime. Review of all telemetry for all spacecraft.

22:00 UTC
Harold sends .EXE which was partially uploaded to Bob to finish uploading. Sends a list of diagnostic variables to WEBER ground station crew to download on their next orbits, or calls to coordinate use of uplinks for Weber access to their experiments.

22:00 UTC
Bob prepares and tests new command and control software for next spacecraft. Harold works on making ground upload software distribution. Weber tests final camera code on software simulator at Weber, in preparation for sending to Harold to run on the hardware simulator.

01:00-04:00 UTC
Bob completes upload of new software. Prepares source for next spacecraft for start of new cycle. Answers fan mail. Calls Harold to confirm software uploaded.

04:00-06:00 UTC
Harold back to TRW. holds breath, tells spacecraft to terminate the old program and start the new one. Calls Bob to discuss the day. Gets call from Weber on the diagnostic values. Bob to bed.

06:00 - 08:00 UTC
Harold and TRW ARC crew tapes or copies other spacecraft in realtime. Review of all telemetry for all spacecraft. Harold puts status message on telemail.

12:00 UTC
Bob up, start again.

Coming events:
Harold and Bob polish resumes, as above schedule leaves no time to pick up paycheck, let alone do work.

Once the basic hardware is checkout, and the batteries are in good shape, this frantic schedule will change. Once the loader and the command software are done being tweaked, they will be turned over to the production command groups, hopefully by the end of this week.

The next goal is to load the application software. Weber will be ready to do that is a few days. I have to take a business trip, and more development needs done, which will delay the uploading of the first user-access software until late February. This will allow time for the final hardware checkout, which will include memory tests on the 8MB mass memory, determination of channel center frequencies, required uplink power, and the like.

706. Microsat lifetime estimates

Newsgroup: rec.ham-radio

From: HPRICE
To: docs
Subj: Lifetime

I've been asked by several people what the expected lifetime of the Microsats is. There are probably three main limiting factors: orbital decay, battery life, and radiation total dose.

1) Orbit lifetime. A chart in the Satellite Experimenter's Handbook shows a lifetime of 40000-50000 days at our altitude, or somewhere around 120 years; so orbital decay is not our main worry. The most recent Oscar to succumb to orbital decay while still active was UO-9. It was launched into a 500km orbit, and lasted eight years.

2) Battery lifetime. This has been the limit to lifetime for the majority of amateur spacecraft. The early OSCARs where limited to whatever charge was in the batteries at launch, as they didn't have solar cells. Later, the limit was in the number of charge/discharge cycles that could be performed. The microsat/uosat orbit gives 14 charge/discharge cycles each day, although the discharge is not very deep. All the spacecraft have variable transmit power levels, so as the solar cells weaken over time (due to radiation damage), and it takes longer to recharge, we can reduce the transmitter power to proportionately reduce the depth of the discharge. The microsats can be varied in 15 steps from tens of milliwatts to 3-4 watts.

The batteries in OSCAR spacecraft in low orbit have lasted between five and eight years. UO-9 was still looking good as it re-entered after 8 years. The spacecraft that most closely models Oscars 14 through 19 is UO-11. UO-11, launched in March, 1984, has batteries with the same part number as the current spacecraft. They were procured in much the same manner, and where matched and tested by the same group of VITA volunteers in Canada, led by Larry Kayser. These batteries have shown no signs of weakening after almost six years in orbit.

3) Radiation Damage.

Anything above the protection of the atmosphere is subjected to radiation exposure. This is due to the direct and secondary effects of high energy particles, from the sun and elsewhere. In addition to possible immediate affects, such as flipping a bit from 0 to 1 or 1 to 0, which is correctable, a particle hitting

in just the wrong place can cause uncorrectable errors, such as a wrong operation internal to the microprocessor, or worse case a cmos latchup, resulting in high current draw and overheat/fry. The bit flipping is common, the latter events are very unlikely.

We are more likely to fail due to the cumulative effects of this constant bombardment, something called total dose. Once the total dose reaches a certain point, the gates in the transistors that make up the computer and its memories will no longer switch, and that's it. As far as predictions on when this might occur, it would be easy except for two things, we don't know what the total dose in this orbit is, and we don't know the limits for the parts used. That is one of the many things this mission will tell us. UO-14 and UO-15 both carry a package that will measure the total does received. That way, providing non-critical parts fail first, we can begin to characterize the radiation susceptibility of the non-radiation hardened parts we use.

It should be noted that the microsats are in a much more benign orbit than is AO-10. AO-10 did not quite reach the desired orbit, and with its 4000k perigee, spends more time in the Van Allen radiation belts than was planned. AO-10's memories therefore failed sooner than hoped, but the other electronics, the transponders, batteries, and solar arrays live on. Through no-longer actively attitude control, and therefore subject to seasonal variations is solar power, transponders are still usable many weeks of the year.

AO-13 is in a better orbit with a lower perigee, and should have a longer life.

A fourth reason for failure, random failures, won't be treated here. See the Satellite Experimenter's Handbook, available from AMSAT, ARRL, and better equipmented ham stores, for more discussion on the subject of lifetime.

In summary, we have no practical limits to life from orbital decay, the same batteries have worked for 5+ years with no degradation yet apparent on UO-11, and we don't know how long the high density chips that make up most of the microsat CPU will last. Based on rough estimates of the dose in this orbit, and what the chips can take, we would not expect any problems in this area for two to three years. Since the mass memory is byte-wide, many types of single-chip failures can be avoided in a manner analogous to locking out bad sectors on a hard disk.

UO-11, which uses somewhat similar technology chips, has survived almost six years with a failure of only one small section of memory, and that was several years ago.

We shouldn't hear a fat lady singing on 145.825 for some years to come.

tm>ground water in that area? I know for sure you could get into big

Tue 01-30-1990 [21:59]
It doesn't in Florida, apparently. My mom and stepdad live in the
panhandle (near Panama City). The whole area is such that you can't
dig down more than three or four feet without hitting water. I
don't know if it's salt water, but some of it is (or brackish).
That's why there aren't any basements! Gee, tornado watches are
real fun, grin! I'd rather have the midwest winters and a
BASEMENT. I got caught in a tornado while working at a TV station
in an old Marine barracks a few years ago. No fun at all :-(
My stepdad is putting up an 85-foot crankup. I couldn't believe
the FM and TV DX that thing got at another location while it was at
it's lowest level (before crank-up). He should do pretty good with
a 2-meter, scanner, and FM antenna, not to mention his beams.

Another blatant example of the divulging of the contents of intercepted non-broadcast communications has been spread all over the national news in regard to the crash of the Avianca jet near New York. I heard broadcasts of tapes of conversations with people variously identified as "hams" (no idea if they really were) or "scanner listeners" who were reciting what they heard of the plane-to-controller communications.

This is a clear and explicit violation of the law. If the FCC doesn't do anything in this case, then everyone should consider the law meaningless and ignore it from now on.

>Mailer: Elm [revision: 64.9]

I've been taking a lot of DOVE telemetry lately, and noticed
that it always has this fading characteristic. It seems as if the
antenna is directional, and rotating. The doppler seems well behaved,
just the signal strength increases/decreases in a sine wave like pattern.

Is this an artifact, or have others noticed it too? On a low
pass (20 degrees), this will knock out about one packet in 5 on the
telemetry channel. Not a problem, mind you, just interesting. Also,
I notice that the satellite is putting out 3.6 watts on average, although
last night (1/30), it seemed to have dropped to 3.25 or so. Is it intended
to run at the power all the time, or be decreased when other modes are
enabled?

Sounds like the phase splitter capacitor is bad. It is the big
capacitor in the control head. The motor is a two-phase affair
to get a spinning field to make the armature turn. If the capacitor
goes bad, the motor doesn't run. If you have a manual with a
schematic, you should be able to pick out the capacitor and get the
appropiate replacement.

All (I believe) of the newer phones use one of 10 channels in the
46.61-46.97 MHz range, 30 KHz spacing. Like the older ones, the
base transmits both sides of the conversation. Handsets are still in
the 49 MHz range, but I don't bother with them... :-)

Search for the base units between 46.61 and 46.97 MHz.

I think the new FCC regulations specify frequency ranges
rather than discrete channels for cordless telephones, but here
is a list of the channels used to date.

Another look at the August 1987 Radio-Electronics SCA rcvr. project shows
that they have a one transistor amp between the LM3189 FM IF and the 565 PLL.
The filter is also much more complex than the one Eric posted.
A good place to start.

716. AM Returns are in...

Newsgroup: rec.ham-radio
Date: 1990-01-31 19:55:12 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <197715@Wayne-MTS>
Source record: 13780

To all AM fans: Thanks for your patience. I recieved a number
of interesting replies, most of which are gived in edited form
below. However...the ever loquatious WA6NCX supplied the entire
text of a very interesting article he wrote a while back, along
with permission to repost it, which I have done. So thanks to all
to answered my query.

My main AM transmitter right now is a old Heathkit Apache, although I
have a homebrew 833 rig, gonset G76, and a military TBW4 which all
operate AM. I have used a kenwood ts680 on AM in the past with good
results.
Chuck (WB3FJJ)

...I run AM occaisionally on 10 m (29.0 MHz and above)
using my TS930S and Ameritron AL80A amp. I drive the AL80A for about 150
to 200 W acrrier, giving me about 6 dB headroom. I'd love to have my Dad's
Globe Champion (350 W of plate-modulated AM that will also heat a small home)
or one of those beautiful Johnson Viking II's, but just don't have the room
right now. (Kim N5OP)

I have a converted Radio Shack TR452, modified for CW (tho it
still does AM). I never use the thing but would like to ... [sigh]
time is a tyrant.

Rick Troth

...I haven't operated much but I do have an AM rig.
I plan to use my Johnson Viking II ($10 at Ham swap) with my Sony 2010
receiver. The Viking II was made in 1953, has 10 tubes (VFO's excluded).
Its output is rated at 130 watts for CW and 100 watts for AM (at 10 m freq.).
It covers 160 m through 10 m (no 17 m band). Final PA uses 2 6146's.
I'm putting up my 40 m dipole tonight, hopefully.
Thang Le/AA6SV

I operate AM 29.000 to 29.100 MHZ on 10 meters. Equipment is a Drake T4XC/R4C
combination. Also, 14.286 is good, as well as 7160, 7290, 3870-3890 khz.

I am not really what you'd call an old-timer, just drawn to it for some reason.
Can't beat the fidelity, and a friendlier bunch of hams you'll never meet.
Bob (N4CDO)

....I operate several stations using this mode:
XMTR's: Heath TX-1 Apache, Johnson Ranger, Johnson Viking I, Harvey-Wells
TBS-50, Homebrew plate-modulated rig. Am also building a pulse-
width modulated AM transmitter using a 4-400A as the class D
modulator in the negative lead of a 4-400A class C RF PA.
RCVR's: R390/URR, NC-100XA, SX-28, HQ-170A.

Also I operate a 6&2 meter AM station consisting of a Johson Viking 6N2 powered by the modulator/power supply from a DX-100, Johnson 6N2 receiving converter, and BC-312 receiver.

In all cases the moduator sections have been modified to various degrees for better frequency response and lower distortion of the audio.

AM frequencies I can be found on: 1.885-1.890, 1.945, 3.875-3.895, 7.285-7.295, 14.285, 21.385, 29.0-29.1, 50.25, 50.40 MHz.

I would just like to add that although AM is one of my favorite modes I also enjoy CW, SSB, various RTTY modes, and packet. Isn't ham radio great?
73, and thanks for your interest,
Larry, NE1S

Though it's just a toy, and i've yet to make a contact with it, I moved a toy superregnerative 49Mhz walkie talkie to 50.585Mhz. That's in the ssb and Am subband. Why 50.585? I found that xtal in my junk box.

----------cut here----------

The Lure of Amplitude Modulation:
A Relaxing Change from Quack Quack SSB and Packet Racket

Rick Ferranti WA6NCX

Introduction

What's the difference between just communicating with another ham, and actually enjoying the contact? Between plugging in a kilobuck solid-state computerized rice-radio, and really operating an inexpensive 30- or 50-year-old classic transmitter and receiver, with all their tuning and loading controls, crystal phasing, drifting, heat, and wonderful smells? Between restricted, sterile telephone-quality voices (or worse, little characters appearing impersonally on a computer terminal), or full-quieting, full-blown good fidelity audio, so clear that you can actually recognize whom you've QSO'd just by hearing their voice at a flea market?

The difference is the modulation mode -- not SSB or Packet or other modern ``advanced communication'' methods, but full-carrier double-sideband amplitude modulation, otherwise known as AM. Its characteristics of fine voice fidelity, noise quieting, and non-critical tuning give it a classic appeal. Simple, inexpensive equipment is all that's needed. And there's romance in hearing the static break through a slowly fading carrier while you fiddle to get the last bit of oomph out of your receiver, until the signal builds up again and the QSO continues. Then it's your turn to transmit, with a clunk of several relays and a long, relaxed transmission, so unlike the hyperspace machine-gun contest-like exchanges of the SSB crowd.

I have held a fascination for AM operation for years, and have owned or operated much of the classic equipment from the 30's to 50's. More and more I seem attracted by radios that glow in the dark and don't slide off the operating table when I plug in a set of headphones! If you'd like a change from the rat-race tinny sound of SSB and the digital rf garbage, consider switching to a mode as old as radio itself. Here are some of my impressions of the equipment and operating practices of the group using Amplitude Modulation.

Receivers

There are many fine AM receivers, some reaching back more than 50 years. The National HRO and Hammarlund Super-Pro are excellent examples, both having been designed in the early 1930's. My current favorite is a National NC-100X from 1936, a sort of streamlined HRO

with built-in coil sets and power supply. Waiting in the wings for my restoration in an RCA ACR-175, another great communications receiver from the mid-thirties. Good quality 1940's and 1950's descendants of these receivers, like the HQ-129X or the NC-300, are also favorites of the AM operator. I'd stay away from lesser makes like Hallicrafters, unless you latch onto their top-of-the-line models like the SX-28. Whatever you do, don't try to use a sideband transceiver as an AM receiver -- the narrow SSB filter kills all the nice audio fidelity. Quality vintage receivers are often sold for $50 - $100 at flea markets; my NC-100X was simply given to me!

Transmitters

Many AM'ers pride themselves on their homebrew transmitters, often with audio fidelity rivalling that of a shortwave broadcast station. (No, I'm not interested in arguments about ``wasting bandwidth'' by using AM. The same argument says we are wasting bandwidth on SSB -- we should all be on CW or narrow-shift RTTY. Anyway, if you think about it, all recreational use of amateur radio is ``wasting bandwidth.'') Some homebrew rigs are truly amazing -- a 4-1000 modulated by a pair of 4-400's, for example, or one Northeast ham who runs a homebrew kilowatt pulse-duration modulated transmitter!

But that's all a little exotic. Most AM'ers run classic commercial rigs, all the way from the beautiful kilowatt Collins KW-1 to the minuscule Gonset Commander. Several Collins KW-1 transmitters are quite alive and on the air; three hams I can think of who use theirs regularly are K1MAN in Maine, W8AHB in Michigan, and KW1I (really, that's his call) in New Hampshire. The KW-1 is pretty much in a class by itself as far as quality and sheer power; the Johnson Desk Kilowatt comes next, and then the relatively cut-rate Globe King 500 series. Lots of Johnson Valiants, Vikings, Heath DX-100's, and even surplus behemoths like the BC-610 also show up. A favorite for fine quality modulation, without breaking the back or the electric meter, is the Johnson Ranger. It runs about 50-60 watts output with built-in VFO, covering 160-10 meters. Lots and lots of these are heard with excellent results. I've contacted AM'ers all over the country with mine (and yes, I got it for free too!)

Listening In

As you may gather, there are pockets of AM activity all over the country, though most of what I monitor originates east of the Rockies. Typical frequencies used by the AM crowd are 1885, 1945, 3860-3890, 7290-7295, 14286, and 29000-29100 kHz. The 20 meter frequency comes alive at 9 pm here in the East; in California listen at 6 pm to hear some really big signals from all over the U.S. The 10 meter ``AM window'' is full of signals when the band is open; it's great for low-power work, even with converted AM CB sets. (I recently had a long QSO with a Texan running a converted CB at 2 watts output -- his signals were strong enough to close the tuning eye on my NC-100X and quiet the background noise, and I was 20 over 9 down there with the

Johnson Ranger from my QTH near Boston).

More Information

If you're interested in learning more about the AM scene in the country, a very nice monthly 16-page newsletter is the AM Press/Exchange, 2116 Old Dover Road, Woodlawn, Tenn. 37191, published by Don Chester K4KYV. A year's subscription is only $10, and even if you aren't a subscriber you can still run free AM-related want/sell ads every month. Good place to try to find a KW-1!

Personal Beginnings

I got interested in amateur radio over 20 years ago, listening with my 4-tube Knight-Kit ``Star Roamer'' (which I still have) to a 160 meter AM net called the ``Igeroties'' (the name is reputed to mean ``head hunter'' in Swahili). It was run by Fred K6YT (then W6QWF), and its members comprised a fascinating collection of characters, including W6EAJ, who lived on the side of a mountain somewhere in far Northern California (Horse Mountain Ridge), and whose house and station were powered by a water wheel. When I got licensed in the early 70's I would chat with these folks using an old DX-100 or a surplus TCS transmitter. Since I moved from the San Francisco area to the East Coast some 13 years ago, I've often wondered whatever happened to the infamous ``Igeroties.'' Now I listen to Eastern 160 meter AM activities, including the ``Grey Hair'' Net on 1945 KHz. And, the Society for the Promotion of Amplitude Modulation (SPAM) has an 80 meter AM net as well.

Conclusion

Even if you think all this is quite antiquated and doesn't meet current notions of high-technology, you'll have to admit that the clean, opulent tones of a well-modulated amateur AM phone station sound just wonderful, especially when they emanate from a classic receiver of ham radio's golden age. You can participate in that quality and enjoyment with little expense and a bit of digging, and join the fun of operating with Amplitude Modulation.

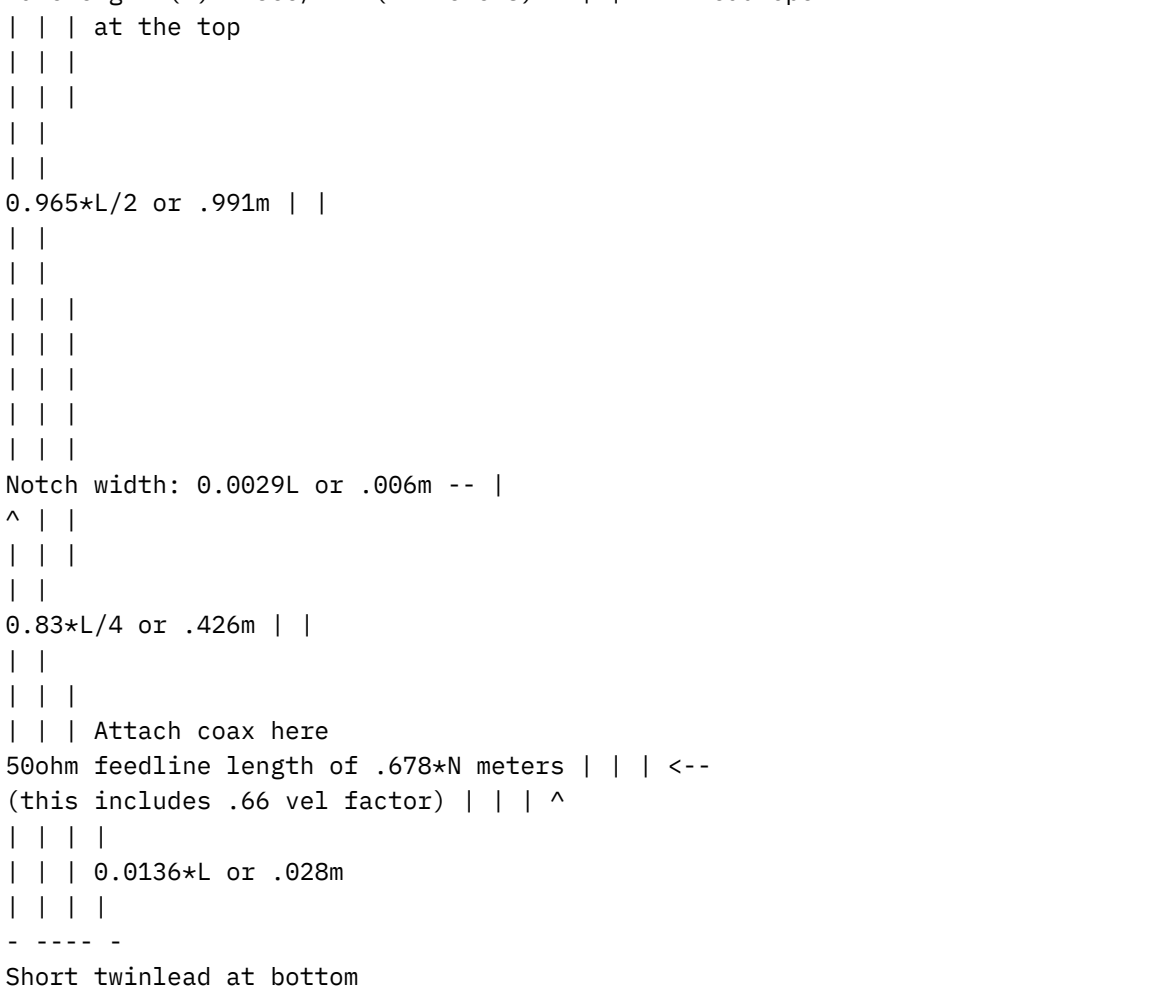
719. Ribbon J-pole Correction

Newsgroup: rec.ham-radio
Date: 1990-01-31 20:06:15 UTC
From: jsb@hpfinote.HP.COM
Message-ID: <16170012@hpfinote.HP.COM>
Source record: 13766

After reading the discussion about 300 ohm ribbon j-poles recently, I thought it would be fun to build one. However, the finished product was resonant around 116Mhz, resulting in a 15-20db worse signal than my rubber duck on 2 meters!

Some investigation revealed a mistake in the construction plans. This was confirmed by an paper published in April '82' QST.

The following plan is for a j-pole resonant at 146Mhz and a bandwidth of 4Mhz, for a SWR < 2:1. Velocity factors can be critical here and I used .83 as specified for Belden 8230. Also the feedline must be an integer muntiple of 1/2 wavelength to mininize rf currents on the shield. Connect the center conductor to the unnotched side and the shield to the notched side at the 0.0136*L point.



Wavelength (L) = 300/Mhz (in meters)
twinlead open
at the top
0.965*L/2 or .991m
Notch width: 0.0029L or .006m --
0.83*L/4 or .426m
Attach coax here
50ohm feedline length of .678*N meters
(this includes .66 vel factor)
0.0136*L or .028m
Short twinlead at bottom

After I get one of these put together I'll let you know if it works.

720. Nasty AMSAT letter

Newsgroup: rec.ham-radio
Date: 1990-01-31 20:13:10 UTC
From: mac@idacrd.UUCP
Message-ID: <593@idacrd.UUCP>
Source record: 13769
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

The following letter (with all its mispelling and poor grammar) was sent to lots of folks on the west coast of the U.S. Several in LA and San Diego received it. It appears as if it were sent from AMSAT. I can assure (as a director of AMSAT) that this letter has NOTHING to do with AMSAT. We just don't play the game this way, feeling it is all ways better to play it straight and face-to-face when we have these problems. 145.825 Mhz in particular has come to be `the educational channel' in satellite communications and I would presonally appreciate it if people could stay off this frequency with their transmitters so that we can copy the weak (and not so weak in the case of DOVE) transmitters. I wish to repeat myself, AMSAT had nothing to do with this letter.

73 and thanks for your support,

Bob McGwier, director AMSAT

Misleading letter follows:

Dear Amateur Radio Licensee

No doubt you are now familiar with the fact that our community has six new satellites in orbit.

While some of these satellites can be commanded using specially designed packet radio modem units, most are for experimental and educational uses.

The DOVE Microsat and it's [sic] telemetry on 145.825 MHz is such a satellite. It is not a BBS, nor is it an orbiting digipeater.
It's [sic] telemetry on the 2 Meter band was designed for those with existing packet radio equipment interested in satellite activity to monitor satellite parameters without buying and installing specialized 9600 Baud Phase-Shift-Keyed modems and using SSB radios.

Your callsign was recently monitored by a governmental station on the above frequency. Not only is this bad operating practice, but also illegal.

Please bear in mind that the 2 Meter band from 145.8 to 146.0 is an internationally recognized amateur satellite band. In addition to the DOVE telemetry, there are several linear satellite up- and downlinks in this frequency range that are still being used.

We realize that this may be a new mode of operation among some within the amateur radio community. When leaving your station unattended to

monitor the DOVE satellite, we recommend that you set the XMITOK command OFF. This will keep you, or another station from activating your 2 Meter transmitter and subjecting your station to further action.

For information about the Amateur Satellite program, please send a stamped, self-addressed envelope to:

AMSAT, PO Box 27, Washington DC, 20044

> performing additional work to N4HY's PACSAT decoding software
> for the PACSATs (including DOVE).
>

I have made my last posting of the decoding of the raw telemetry values
to CI$ and to DRIG (AMSAT BBS). The stuff that Joe will be working on
is taking this rudimentary package and adding all the DERIVED values
that you REALLY want to see, graphing of particular channels and easy
data collection for particular channels. Now that I have my own
serial interrupt drivers in the code, and Joe has taken over to clean
up my mess, this should be a nice package. I envision helping Joe
add UOSAT and FUJI OSCAR <<<20>>> which will go up February 7 (who
said that amateur radio satellites were dead because they couldn't
get launches) as well as the earlier UOSAT's if there is time. In
the end it should be a very nice package and Joe is the right person
to do the job.

722. POCSAG protocol info

Newsgroup: rec.ham-radio
Date: 1990-01-31 22:00:26 UTC
From: dg2kk@infodn.rmi.de
Message-ID: <294@infodn.rmi.de>
Source record: 13773
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I am looking for details on a protocol called POCSAG which is used to
send messages to paging receivers.

Things I would like to know:

- What type of modulation is used ((A)FSK, MSK, etc.)?
- What bitrate is used to transmit the messages?
- What is the format of a message sent out over radio?.
(Ideally this would be some kind of hex-dump with a short description
what each byte means.)
- Are the messages sent synchronously or with start/stopbits?
- How are the messages encoded (ASCII)?
- What kind of checksum is used (CRC, parity bits)?

Motorola and other manufacturers of paging receivers use this protocol,
so it must be fairly standard.

Thanks in advance!

-Walter

723. ICOM IC-R1

Has anybody out there any first hand experience with ICOM's new hand-held
receiver IC-R1?

For those of you who don't know: the IC-R1 is a communications receiver
which covers 100kHz-1300MHz. The design is similar to the IC-2S series.
It has a built-in clock and timer, 100 memory channels, search scan,
a tuning knob, S-meter, power save function and probably other features
which the ad I am looking at does not mention.

I think FEMA has come up with a spec too. Seems it was like 3 legs of 20 feet of thick copper spaced at 15 degrees of seperation and joined at the end where you attach your ground wire ... A few inches below the ground.

I don't know of a publication but I am told the Local police comm center has this setup .... took a direct HIT from lightening and there commercial VHF/UHF stuff kept working.

725. Re: J-pole verticals

Newsgroup: rec.ham-radio
Date: 1990-01-31 23:41:53 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <7880115@hpfcdc.HP.COM>
Source record: 13767

The upper end of a J-pole is an end-fed halfwave (Z approx 1 Kohm). The lower part is a shorted quarter-wave matching section. I suppose the Z along the matching section varies from 0 to 1K. The trick is to find the 50 ohm point.

At VHF, I found that coax had too much shield current (SWR varied wildly depending on where the coax was). I looped three turns of the RG-8X feedline in a 1" diameter coil (a choke balun) close to the feedpoint to overcome this.

Neat antenna. No need for a groundplane, because it is halfwave. I have a couple of the 300-ohm twinlead versions for portable use. Packs well in a suitcase. Hang them in any convenient corner and you're in business.

You could probably buy a good multi-band 100W used radio for $400. I got my Kenwood TS-520 for $250. While not new and whizzy, it gets the job done. Check recent QST for an idea of what's available.

I have a friend that says you should spend the big bucks on antennas, not transmitters.

Good luck on 10 meters. Most fun/Hz of any of the bands, when it's up.

There are already national EMS groups working on just such a thing.
There was a mention in a recent issue of _Emergency_ magazine about it.
(No, I don't recall which one; next time I'm at the station, I'll look.)

The need is certainly there: our unit, for example, shares a frequency
with all of the miscellaneous departments of our city. They treat the
pager tone as a call to all start talking at once; I raised hell with
the director of public safety, and he got the city manager to write a
policy letter stating that all other users are to get off the channel
during ambulance calls, but that's being somewhat ignored. Our police
and fire departments are moving to 800 (it's been "two weeks now" since
last October... :-( ), and we'll inherit the old PD repeater. That will
be nice. Still, other EMS units are in the same or worse shape, and they
need the new frequencies.

I once saw a catalog of some military grade connectors (I don't remember the manufacturer) but there were some various connectors that had rotatability to them. I don't remember if an angled TNC one was in there that would suit your needs. But you might call up places like Amphenol and ask them if they have any such connectors.

I have used BNC-BNC/BNC-BNC folding connections like you described for my 2 meter HT. After a few months of use, I found the connection points to be wearing rather bad. I'll try again with high quality silver connectors at a later date. I quit using them. I was also getting so rather distorted radiation patterns. Towards the end of my usage, horizontal was at least 6db lower with the double-angle folder than without it. Usage was always with rubber duck sold with the radio (IC-2GAT) or the mini one (for IC-2SAT).

Try this. Use your 2 TNC-TNC connectors. Get some blue Loctite (the
weakest grade.) Apply a bit to each threaded surface. Tighten
the connectors up until it no longer flops but does not bind. Allow
to sit a half hour or so until the Loctite cures. Enjoy. I tried
this setup here on my phone and it works just fine. The blue loctite
is weak enough that the connectors can easily be broken loose if
necessary.

733. FCC Snippets

Newsgroup: rec.ham-radio
Date: 1990-02-01 12:55:17 UTC
From: pescatore_jt%ncsd@gte.COM
Message-ID: <9002011255.AA21646@bunny.gte.com>
Source record: 13777

FCC EXPECTED TO MOVE
ON AIRFONE ALLOCATION

STATUS: The FCC will take long-awaited action during its March open meeting on the allocation of spectrum for air-to-ground service.

COMMENTS: The Commission is expected to make a decision on allocating radio spectrum to air-to-ground use and how many entities will be licensed to provide the service. The FCC will decide, in a separate proceeding, who those licensees will be.

The Commission is weighing the benefits of two providers vs. a single provider or a system in which the air-to-ground provider(s) would share the spectrum with other radio services.

ENHANCED WIRELESS
PROPOSAL TAKES SHAPE

STATUS: Responding to criticism of its request for spectrum allocation for enhanced wireless technology, PCN America has filed reply comments with the FCC.

In its reply PCN America provided additional information on its proposal. The proposed system will utilize spread spectrum technology and use 100 MHz of spectrum in the 1850-1990 bands. Original comments filed with the Commission by other parties condemned the proposal as too vague to warrant FCC action.

COMMENTS: It has been suggested that PCN America did not have detailed information on the proposal at the time of its initial petition. During the two months between the filing of its original petition and its recent reply comments PCN America has gathered considerably more information on which to base its request for spectrum allocation. That new information is reflected in its reply comments.

The FCC is reportedly very interested in reviewing the PCN America proposal because it could provide additional spectrum for new uses without displacing current users.

At a recent seminar on enhanced wireless technology, Tom Stanley, head of the FCC's Office of Engineering and Technology, said that the FCC would issue a paper on this subject later this spring. The paper is expected to describe the various types of enhanced wireless technologies.

The FCC will have to take subsequent action, either a Notice of Inquiry or a Notice of Proposed Rulemaking, to respond to PCN America's Petition.

COMMISSION TO FORM 1992
WARC ADVISORY COMMITTEE

STATUS: FCC Commissioner Sherrie Marshall and BellSouth Director of International and Agency Relations Frank Urbany have been named co-chairs of an FCC Advisory Committee for the World Administrative Radio Conference (WARC-92).

The Advisory Committee will advise the Commission on preparations for WARC-92. The committee also will propose U.S. positions on issues that may arise at the conference.

734. f-series connectors

Message-ID: <3392.25c8193a@vax5.cit.cornell.edu>
Source record: 13788

Hi All,
I am looking for some information which may border on the sorts of things that people are doing with ham radio, so even though I know nothing about what I'm saying, here goes . . .

A friend mentioned that AppleTalk could be transmitted over radio frequencies as well as phone cable. He said that you just had to pick the frequency and use a low enough power so the FCC didn't get upset. My questions start with this: How low power must the transmitter be to comply with FCC regulations? Also, what kind of distance could such a transmitter hope to achieve, preferably not line of sight (it's a hilly area)? I gather that to avoid the line of sight problem requires using a fairly high end of the spectrum, somewhere in the FM range. Is this true? Assuming all of this is possible, I'm also curious about the KA9Q package which allows TCP/IP communications over some sort of line. What type of physical connections are required for KA9Q and also where can I find the software? I gathered that it is public domain/shareware but I haven't seen it on the sumex-aim server.

Thanks a lot and please reply by mail if possible since I don't read the ham radio groups too often.

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

Mark Espinosa/WA6RGD

737. Test

Newsgroup: rec.ham-radio

Here in northwest New Jersey, many towns still have police, emergency
and other municipal services in the 30-50 mhz band.

739. Microsat telemetry equations

Newsgroup: rec.ham-radio
Date: 1990-02-01 16:06:16 UTC
From: mac@idacrd.UUCP
Message-ID: <595@idacrd.UUCP>
Source record: 13796
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I will post the equations for decoding the microsat telemetry. I forgot
to bring in the status bits (but they are changing about once per week
whereas the analog telemetry is NOT). This will all settle down soon.
I apologize for this taking so long to get out.

>
> HB9NBB

Hello Joseph:

You are correct about this fading. The Microsats are all still tumbling
and are slowing down nicely. Soon the interaction of the photonic pressure
on the antennas (hanging down like four legs at an angle from the bottom
of the spaceraft), with one side painted white and the other black, and
the bar magnets on each of the four corners will induce a twice per orbit
rotation with a spin about the 'Z' axis. The downlink antennas are
circularly polarized. This is in order that LINEAR antennas on the
ground would optimal and has worked well on the early oscar's. The complex
interaction between bar magnets and photon pressure spin has been damped
to prevent much wobbling by hysteresis dampers. This all sounds great
right? Weeellllllll.. . . being a fly for free organization, this was
all designed seat of the pants, and even though it has worked well in the
past, we hope to be ABLE to claim that it is working well again.

In regards to the power, the algorithm on board, which I wrote, is a smart
battery charger. It does the charging by load side management, not supply
side as has been done on ALL previous oscars. When we turn on the S band
transmitter later, you will definitely see this power go down along with
your ability to decode these packets. The other microsats decode at
0.5 watts out (when that is necessary) and low on the horizon because
we used PSK and not AFSK on them. The final analysis is that the power
is determined by an algorithm which is trying to maintain a net positive
power budget on the spacecraft while charging ALWAYS at the maximum
possible efficiency.

Bob

From: nrg@nsscb.UUCP
Message-ID: <1218@nsscb.UUCP>
Source record: 13803
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Recently I bought a Sony-2010. I found it's sensitivity no better than
Sony-ICF7601. When I turn it on to tune to 11620khz in the morning (7:30est)
I am getting lot of strange noise. The noise is very similar to the
one comes out of a big transformer. Also there is lot of static noise.
Our apartment complex is not in the vicinity of any kind of transformers
or any other industries. I tried to use a Radio Shack AC line noise filter.
But it did not serve the purpose. I think the noise/static is being radiated.

This situation persists for 11620, 11820, 9665, 9910, 15335, and 7412khz. Also I
tried to tune to these stations in the early hours like 3:00EST but
found the situation no better. I bought this radio only for the sake of
tuning to these stations. Does any one have a possible answer for this
agonizing situation.

>Motorola and other manufacturers of paging receivers use this protocol,
>so it must be fairly standard.
>
The POCSAG (POST OFFICE CODE STANDARDIZATION ADVISORY GROUP) code format
consists of a 576-bit preamble and one or more batches of codewords. Each batch
comprises a 32-bit frame synchnonization code and eight 64-bit address frames
of two 32-bit address or idle codewords each. The frame synchnonization code
marks the start of the batch of codewords.

Pre-amble Structure:
The preamble consists of 576 bits os a 101010 pattern transmitted at
a bit rate of 512 bps. The decoder uses the preamble both to determine
if the data received is POSAG and for synchronization with the data stream.

Batch Structure:
A batch consists of a frame synchronisation code followed by eight
frames of two address codewords per frame (16 address codewords per batch).
In order to maintain the proper batch structure, each frame is filled with
two address codewords, or two idle codewords, or any appropriate combination
of the two codeword types.

Frame Synchronization Code Structure:
The frame synchronisation (FS) code is a unique, reserved word that
is used to identify the begining of each batch. The FS code comprises the 32
bits: 01111100110100100001010111011000.

Address Codeword Structure and Code Capacity:
An address codeword's first bit (bit 1) is always a zero. Bits 2
through 19 are the address bits; the pager looks at these bits to find its
own unique address. Each POCSAG codeword is capable of providing address

information for four different paging sources (Address 1 through Address 4). These addresses are determined by combinations of the values of bits 20 and 21 (the source identifier bits). Bits 22 through 33 are the parity check bits, and bit 32 is the even parity bit.

The combination of the code plug's three pre-coded frame location bits and the address codeword's 18 address bits provide over two million different assignable codes. In this combination, the frame location bits are the least-significant bits, and the address bits are the most-significant bist.

Message Codewords:
A message codeword always starts with a 1 and always follows directly after the address. Each message codeword replaces an address codeword in the batch.

Idle codeword Structure:
The idle codeword is a unique, reserved codeword used to take the place of an address in any frame that would not otherwise be filled with 64 bits. Thus if a frame would only contain one address, an idle codeword will be added to complete the 64-bit frame. The idle codeword comprises the 32 bits: 01111010100010011100000110010111.

The preamble takes 1.125 seconds
Each batch takes 1.0625 seconds

The signal is a frequency shift keyed signal of +/- 4.5kHz
See CCIR Code #1 for further details.

Also used for paging is the GSC (Golay Sequential Code). More about that some other time ....
But now this.....

Well, actually, YOU can initiate a new newsgroup. A very short
summary of how to do it is: Read the doc which is posted once a month
or so in (I think) news.announce.newgroups on how to get a newsgroup
started. Decide on a name, charter, if it will be moderated or not,
things like that. Announce, in news.announce.newgroups, a call for
discussion about the newsgroup. Start reading the newsgroup that
the discussion takes place in (news.groups, I think) and take part
in the discussion (or ignore stupid remarks, whatever :-)).

IF all goes well, then you announce a call for votes. (about 2 or 3 weeks
after the call for discussion). Count the EMAIL votes. Announce the
totals in news.announce.newgroups. If, after a month
of voting, you have 100 more yes votes than no votes, and a 2/3 majority
of yes votes (I'm hazy on the exact numbers, sorry), then you announce
that the group succeded and you send a message to Gene Spafford asking
him to create the group.

WARNING - read the details mentioned first before doing this, as I've
skipped a few details...

But don't worry, its not really very hard. I encourage you to
go for it.

Source record: 13799

Some months ago there was flurry of messages concerning a station operating
from Burkina Fasso. Perhaps the following magazine article will be of interest.

XT2CW
A Week in Burkina Fasso
by
Rudolf KLOS - DK7PE / AH0G
translated from MEGAHERTZ (France), January 1990 issue

Some people remember this country under its former name of Upper Volta, with
its capitol having the typically African-sounding name of Ouagadougou.

HOPE FOR A LICENSE
For several years there hadn't been any radio amateur activity from this
country. Because of the political situation, the government didn't grant per-
mits to either residents or visitors. In 1988, I sent a request for a permit
intending to activate this country by putting on an amateur radio station. I
truly didn't expect to receive an answer, and above all not a license.
But..., about six months later I had the surprise of a telegram coming from
ONATEL, the Ministry of Posts and Telecommunications at Ouagadougou. This
telegram informed me that I could obtain the requested permission after my
arrival in the country. This news was truly as good as was unexpected.

THAT ISN'T ALL, YOU MUST GET THERE!
The organization of the expedition then started, with the start set for the
4th of August via Paris and Abidjan (Ivory Coast), to reach the country si-
tuated "on the river Volta". Outside of the loss of my fishing pole, all of
the equipment arrived without other damage.

THE NEXT DAY, A DIFFERENT TUNE WITH AN AFRICAN SMILE
The day after my arrival, an official at the ONATEL office informed me that
he wasn't in the habit of giving out such authorizations, and that I would
probably not have my license as rapidly as I would wish. He told me to come
back about a month later to see what had happened. The fact that I showed him
my telegram and explained that my stay was limited to seven days didn't
change the situation at all. Disappointed, I seated myself on a dusty black
plastic armchair and waited there for I-don't-know-what to happen, all the
while a fan turned above my head (which really needed it!).

Patience is one of the most essential qualities in African countries, and all
visitors asking for even the smallest thing need to call on it one day or
another. After having waited about an hour - no one else bothered themselves
with me - another official suggested that I go see another section of ONATEL,
situated on the other side of town. He even had me get in the
administration's brand new Renault 4L to take me there! There, everything
had a more encouraging look, and this section even had a folder on which my

name was written. Inside, believe it or not, was the promised license, with the call XT2CW (wow! there is certainly a guardian angel looking out for hams who like Africa).

QUICK, QUICK, LET'S WORK PEOPLE!
Now the operation could begin and, with the precious document in my pocket, even the manager of the hotel made no objection to my activity from his place. A half-wave sloper for 160 meters, a multi-band Windom for 80 to 10 meters, and an additional vertical dipole to cover 15 and 10 meters, were attached to the roof about 28 meters above ground. W2IYX's propagation predictions were "normal/high" and that was the case. Pile-ups on 10 and 15 m with the US, endless runs with Europe, and good openings toward Japan.

One night, while working a series of US stations on 15 m, I had fail to change frequency on time for a 160 m sked with Europe. As always, I announce my frequency change so everyone knows where to find me. On arriving on my new frequency (1.830 MHz) I heard lots of American stations call XT2CW, and at the end of the sked in question I could contact lots of stations on this fascinating band. I found it remarkable to see 160 meters really open at the time of year with such high solar activity, and especially at a time at which the MUF was so high that 15 m was also wide open. The following days I spent my brightest times on this low band. I even made a very interesting contact there with W9US, whose report was 559, when he had only 1 W output. Several minutes after this first contact he called me again with higher power and his report was S9 plus.

On the seventh day of this expedition, Saturday, August 12th at 1420 UT, to be exact, propagation suddenly disappeared on all bands, a fadeout ("Moegel Dellinger* effect"), recorded in Europe as well. After three hours of continuous background noise all over the bands I could cover, propagation built up little by little, but wasn't as good as before the event.

EVEN GOOD THINGS HAVE AN END
That was the moment for me to close the station and XT2CW was heard for the last time at 1915 UT in contact with OH2WI on the 40 meter band. I left Burkina Fasso with a score of about 6500 CW contacts, to which are added several SSB contacts. I had several FM contacts to my credit as well. With at most 15 hours of sleep during my whole stay at Ouagadougou, and some 3 kg lighter, I'm already thinking of my next expedition.
---------- End of translation ----------
* [note by W3OTC] Dr. J. Howard Dellinger was one of the US big guns of radio propagation research - working at the National Bureau of Standards from 1907 to 1948; chief of its Radio Section and later Central Radio Propagation Lab, 1921-48; also Chairman of the the Radio Technical Committee for Aeronautics 1941-57, developed the old MF aero radio beacon system in the 30s; discovered the relationship between solar flares and shortwave radio fadeouts.

>meaningless and ignore it from now on.

I don't understand this. Are you saying it's illegal to listen in to aviation frequencies? If so, there are a hell of a lot of paper outlaws around. (Since when is that new; 55mph speed limit, etc. etc.)

Maybe I don't understand your story. Are you saying hams and scanner listeners broadcasted on the aviation frequencies? Your account is really confusing. And based on something in the news, which makes it doubly confusing because the news reporters usually don't know what they're talking about. If they did, as I recall as a pilot, in an emergency, anything goes. Hams could help find the airplane, etc. Emergency communications is one of the potential functions of amateur radio, is it not?

The reason I asked is because the docs that came with mine are completely
silent on the issue of crossband repeater operation. Maybe I should have
gone ahead with buying the Yaesu as originally planned. |-<

> the next week or so. I expect to get the mods also. I'll post them if
> they work.

Where are you getting this mod info? I can't even find service docs yet!
And the schematics which came with the unit appear to be inadequate for
comfortable guessing.

============================================================
```

ARRL LETTER - Volume 9 - Number 2 - January 29, 1990 - Part 1 of 3

ARRL BOARD ADOPTS BUDGET, ELECTS OFFICERS

The ARRL Board of Directors met in Hartford January 19-20 to consider reports of its officers and committees, elect officers for two-year terms, and conduct the other business of the League. The Board regularly meets twice a year, in January and July.

As reported elsewhere, the Board declared 1990 "The Year of the Amateur Satellite Program" in recognition of the many important space-related events expected to occur this year. Other actions included ordering continued preparation for the 1992 World Administrative Radio Conference, and continued study of improved methods of spectrum management in Amateur Radio.

A 1990 budget for ARRL was approved that anticipates more than $9.7 million in revenues and expenses for the year. For the first time in nine years, and in recognition of the 50% inflation that has occurred since then as well as the need to maintain adequate financial reserves for future challenges to Amateur Radio privileges, the Board adopted an increase in ARRL dues. Effective April 1, the regular annual dues rate will go from $25 to $30. The senior-citizen rate will go from $20 to $24, and youth rates also will increase 20%. The special rate for family members and blind members will increase by $2, to $4.

Larry Price, W4RA, was reelected as ARRL President. Also reelected were James McCobb, K1LLU, as Treasurer, and David Sumner, K1ZZ, as Executive Vice President and Secretary. There was some realignment of League Vice Presidents, with George Wilson, W4OYI, elected as First Vice President. Additional Vice Presidents elected were Rod Stafford, KB6ZV, and Jim Haynie, WB5JBP. Jay Holladay, W6EJJ, was elected International Affairs Vice President. Tod Olson, K0TO, retired from the Board after 16 years of service as Vice Director, Director and Vice President.

The Board recognized the long service of Chuck Bender, W1WPR, and Laird Campbell, W1CUT, who recently retired from the ARRL Headquarters staff.

Elected to the Executive Committee for 1990 were Directors Butler, W4RH, Mendelsohn, WA2DHF, Quiat, AG0X, and Turnbull, W3ABC. President Price, Vice President Wilson, and Executive Vice President Sumner also serve on the Executive Committee.

In other actions, the Board reaffirmed its earlier position opposing a reduction in AM power privileges scheduled to take effect later this year, and renewed its instruction that a way be found for new club station licenses to be issued and for the holders of expired call signs to reobtain them. A field organization station appointment, Local Government Liaison, was created to better represent Amateur Radio interests at the local level. Endorsements to the 5-Band DXCC Award for 17 meters and 12 meters were approved; application details will be announced later. Studies of a number of issues and proposals were ordered by various committees and the staff.

The complete Minutes of the meeting will appear in March QST.

MORE GOOD NEWS FOR REPEATERS/ REMOTE BASES WITH PHONE PATCH

Karl Pagel, N6BVU, advises that GTE California, Inc. has agreed to provide telephone service to amateur repeaters with phone patch facilities at residential rates. In a January 9 letter to Karl, Karen Shaw, Vice President of Customer Relations for GTE said that they are making the change in the rate retroactive to October 1, 1989.

The policy will apparently extend to all GTE serviced repeater or remote base owners country-wide. Amateur radio repeater groups who are GTE customers may hear from a GTE customer representative explaining their new monthly service rate. Shortly after that, they will receive a one-time credit on their telephone bill. Any group not receiving the call by January 30 should contact their local business office.

ARRL LETTER - Volume 9 - Number 2 - January 29, 1990 - Part 3 of 3

ANNUAL TAPR MEETING

The next Tucson Amateur Packet Radio (TAPR) annual meeting will be held at the Inn At The Airport, 7060 South Tucson Boulevard, Tucson AZ, 85706 on Saturday and Sunday, February 24-25.

"Networking," the packet radio buzzword for the early '90s will be one of the main topics at the meeting. Discussions will also be held by members of the Microsat team describing the construction, prelaunch and launch activity of the Microsats and their UoSAT cousins.

It is expected that many manufacturers of packet equipment will attend the meeting with displays and demos. All the new TAPR kits will be shown and discussed.

Those wishing to be on the speaking agenda should advise the TAPR office as soon as possible. The Sunday session should be concluded near or shortly after noontime for those planning afternoon departures.

TAPR suggests making your hotel reservations prior to February 9 by calling 1-800-772-3847 if outside Arizona, 602 746-0271 if in Arizona, or by writing to the above address.

FLAWLESS LAUNCH YIELDS SIX OSCARS
NEW ERA IN AMATEUR SATELLITE COMMUNICATION BEGINS

On Sunday, January 21 at 0135 UTC, the "brilliant plume" coming from the first stage of an Ariane V-35 rocket marked the beginning of a picture perfect launch of the next generation of OSCAR satellites. At that time Uosats D & E and the four Microsats (Pacsat, Webersat, LUsat and DOVE) began their journey into space from Kourou, French Guiana. An attempt to launch 24 hours earlier had to be "scrubbed" due to thunderstorms near the launch site.

The AMSAT Launch Information Network Service (ALINS) covered the launch and the events surrounding it. ALINS were heard around the world with rebroadcasts by W1AW, WA3NAN, W5RRR and a host of other HF and VHF stations on virtually all amateur bands.

The rocket reached orbit velocity of 7 kilometers/second just before 16 minutes into the flight as it passed east of Bermuda. At 20 minutes, 4 seconds, Uosats D and E were deployed becoming OSCAR 14 and 15. One minute later the 4 Microsats were successfully deployed becoming OSCAR 16-19 respectively.

Ariane Launch Control and AMSAT staff applauded as the amateur satellites were deployed in this "very historic moment" for AMSAT and Amateur Radio.

In a letter to AMSAT President Doug Loughmiller, KO5I, ARRL Executive President Dave Sumner, K1ZZ, congratulated AMSAT for the successful orbiting of the four Microsats. "What the AMSAT team has done, Dave said, "reflects credit on the entire Amateur Radio community. The timing couldn't be better as we begin preparation for the World Administrative Radio Conference to be held in 1992.

"AMSAT can justifiably take pride in providing the Amateur Radio community with a new communications capability. The American Radio Relay League

shares in your pride and is pleased to have had the opportunity of contributing to the project."

In confident anticipation of a successful launch, the ARRL Board of Directors on January 20 passed the following resolution: "The ARRL Board of Directors, on behalf of the officers and members proclaim for all to note that: "Whereas the amateur satellite program represents a major source of technological advancement within the Amateur Radio Community and "Whereas the amateur satellite program has a long history of providing useful communications resources to Radio Amateurs worldwide and "Whereas the amateur satellite program is a major element of the public service, education, and scientific research being conducted via Amateur Radio today and "Whereas the amateur satellite program represents the resourceful, creative, innovative, and volunteer spirit of Radio Amateurs everywhere and "Whereas 1990 will see the launch of eight new OSCAR satellites including six on a single launch vehicle with the Microsat/UOSAT launch and "Whereas 1990 will see the construction of an additional OSCAR satellite by AMSAT Italy and AMSAT North America begin and "Whereas 1990 will mark the beginning of the Phase III-D construction activity by a broad base of international amateur participants "Therefore be it resolved, that in recognition of the contribution of the amateur satellite program to the Amateur Radio service and of the significant events which are to occur during the course of the year 1990 within this discipline of amateur radio, we hereby declare: "1990 the year of the amateur satellite program."

ARRL LETTER - Volume 9 - Number 2 - January 29, 1990 - Part 3 of 3

AMATEUR TELEVISION VIDEO TAPE CONTEST

The Western Washington Amateur Television Society (WWATS) and Amateur Television Quarterly (ATVQ) are sponsoring a contest for ATV enthusiasts world-wide. All licensed amateurs are eligible except members and families of WWATS and ATVQ.

Contest entries should be on consumer grade video tapes 15 minutes or less in duration. They must be Amateur Radio related and may have been made anytime since May, 1988. Entries will be reviewed and winners will be selected by WWATS appointed judges. Winners will be announced and prizes will be awarded at the 1990 Dayton HamVention (r). Entries must be post marked by March 1.

For more details on the contest and to obtain an official entry form write to: WWATS/ATVQ Video Contest, 353 S. 116th St, Seattle, WA, 98168.

CRRL NEWS

CRRL President Tom Atkins, VE3CDM, has retired to devote more time to his family and to IARU work. Tom was recently elected Secretary of IARU Region 2 and will be taking a seat on the worldwide IARU Administrative Council. Effective January 1 the new CRRL President is Bruce Balla, VE2QO.

Bob Benson, Q.C., VE2VW, will soon be retiring as CRRL General Counsel. Bob has served CRRL -- and ARRL before that -- with distinction for some

sixteen years. In that time, Bob did much effective behind-the-scenes work for individual amateurs and their counsels, often helping with RFI and antenna tower cases.

It is expected that Tim Ellam, VE6SH, of Calgary will be appointed as the new CRRL General Counsel at the May, 1990 CRRL Board meeting.

CRRL AND CARF HOLD PRELIMINARY MERGER MEETING

A preliminary merger meeting between CRRL and CARF was held in Cobourg, Ontario on November 25, 1989. The main purpose of this meeting was to set the timetable and agenda for future meetings. The committee agreed to recommend to both its Boards of Directors that a single Canadian organization be formed.

FCC NAMES KB3KC, ASSISTANT BUREAU CHIEF

In a January 10 release, the FCC named Robert H. Ratcliffe, KB3KC, Assistant Bureau Chief (law) in the Commission's Mass Media Bureau. Ratcliffe has held various positions in the Commission's MMB since 1982, when the former Broadcast and Cable Television Bureaus were combined. Before assuming his new position, he served for several months as FCC Chairman Sikes' interim legal assistant for mass media affairs.

PAST DELTA DIVISION VICE DIRECTOR GRAHAM HICKS, W5IHP, SK

ARRL is sad to report the passing of Graham Hicks, W5IHP. First licensed in 1939, he was ARRL Vice Director of the Delta Division from 1961-1964. He was active in establishing and maintaining emergency communications for the Gulf Coast, especially during hurricane emergencies and was also responsible for bringing in many new hams.

A staunch supporter of the ARRL, his life was a monument to the things he considered important, and Amateur Radio was near the top of that list.

GREECE CONGRATULATES ARRL ON 75TH ANNIVERSARY

The Radio Amateur Association of Greece (RAAG) has sent a letter of congratulations to ARRL President Larry Price, W4RA, on the ARRL's 75th anniversary. The text is as follows:

"On behalf of the council and members of RAAG, I have the pleasure and privilege to extend our most sincere congratulations for the 75th anniversary of ARRL and what it represents in Amateur Radio.

"The success of Amateur Radio worldwide owes much to the tireless efforts of members and staff of the League since its founding in 1914.

"Kindest personal regards and best wishes for many more anniversaries to follow--Dimitri Tzelatidis, SV1RL, President, RAAG"

FCC ENFORCEMENT ACTIONS

Per an FCC Release dated January 11, 1990, Frederic K. Stark, KA2YLZ, from West Taghkonic, NY has been fined $1000 for pirate radio operation on 1000

kHz. The FCC received a complaint from the N.Y. State Broadcasters Association in Albany that alleged an unauthorized station was rebroadcasting US Armed Forces Radio Network programs. The unauthorized station apparently interfered with the reception of a licensed station on 1010 kHz.

Using mobile radio direction finding equipment, an engineer from the New York FCC field office located the illegal station at the Stark residence. The unauthorized broadcast station was playing music and gave WNYS as its call letters.

Illegal radio operation is a violation of 47 CFR section 301 of the Communications Act. Unlicensed radio operations may be subject to fines of up to $100,000 and/or one year in prison.

755. Re: cordless telephone freqs

Newsgroup: rec.ham-radio
Date: 1990-02-02 03:51:40 UTC
From: tad@ssc.UUCP
Message-ID: <453@ssc.UUCP>
Source record: 13818

A couple of people asked for cordless telephone frequencies. Here they are:

Base Handset

46.61 MHz 49.67 MHz
46.63 MHz 49.845 MHz
46.67 MHz 49.86 MHz
46.71 MHz 49.77 MHz
46.73 MHz 49.875 MHz
46.77 MHz 49.83 MHz
46.83 MHz 49.89 MHz
46.87 MHz 49.93 MHz
46.93 MHz 49.99 MHz
46.97 MHz 49.97 MHz

I have used the search mode on this area of the spectrum, but found it much more effective to program these channels into memory and scan them. The base unit transmits both sides of the conversation, and is usually audible at a greater distance than the handheld.

I know someone had posted modification info on how to enable the crossband repeater function on these radios, and also how to make them go out of band. I read the article, and didn't think anything of it. But now, I finally own a 731, and I want to do the mods! Will someone please post/re-post the info for me? Thanks!

758. Microsat/UoSAT elements

Newsgroup: rec.ham-radio
Date: 1990-02-02 05:54:09 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19656@bellcore.bellcore.com>
Source record: 13805

Here's a collection of the latest element sets I have for each object associated with the Ariane V-35/Spot/UoSAT/Microsat launch. Note that NORAD has swapped the catalog numbers and international designators for UoSAT-E (UO-15) and the Ariane 3rd stage. As far as I can tell, the other objects' designations are unchanged, and they all gave reasonably good predictions for tonight's passes. --Phil

759. LUSAT and PACSAT data

Newsgroup: rec.ham-radio
Date: 1990-02-02 07:29:10 UTC
From: brian@ucsd.Edu
Message-ID: <11472@ucsd.Edu>
Source record: 13814

In light of the recent posting of programs to decode the telemetry data from the Microsats, and because not very many people have PSK modems to demodulate the 437 MHz transmissions, I thought I might post a good solid chunk of data that people can play with. Herewith the data from two passes this evening. Share and enjoy.

BTW, I used the TAPR PSK modem that comes in a kit for around $110. It took about three hours to assemble it, and perhaps another hour to align it (most of which alignment time was figuring out the somewhat-incoherent instructions, or maybe I was just sleepy at 1 am). It worked the first time I tried it! The receiver I used was an Icom R-7000 with the PSK modem's AFC stepping circuitry hooked to the up/down controls so that it automatically tracked the Doppler shift as the satellites went overhead, which left my hands free to crank the rotator controls.
- Brian

In article <6447@uhccux.uhcc.hawaii.edu> querubin@uhccux.UUCP (Antonio Querubin) writes:
>And you might also want to write to Kaua`i's mayor, Joanne Kunimura.
>
ARGH! As KH6R pointed out to me, that name should be Joanne Yukimura. The
previous mayor was Tony Kunimura. Obviously, I don't live on that island!

For the recent postings requesting odd connectors, i.e. TNC to BNC and sundry other odd items--you might want to try:

Pasternack Enterprises
PO Box 16759
Irvine, CA 92713-6759
(714) 261-1920.

I do not see any right angle adapters in the catalog, however, they do have straight PE9098 BNC-M to TNC-F @ $13.95 and PE9088 BNC-F to TNC-M @11.95. Other odd connectors such as a TNC that fits RG-8 cable or SMA connectors and adapters are listed.

The catalog is free. There is a minimum line item charge of $10.00 and minium order of $100. Ergo, get you friends and cohorts together and place a group order.

How accurate is the power output measurement on the satellite?

Surely there is not a calorie measuring water bath circling our planet.

Where can one get something to measure power more accurate than the
usual 5% quoted by SWR meter makers?

763. IBM and Motorola - radio computer links - where they get freqs?

Newsgroup: rec.ham-radio
Date: 1990-02-02 13:44:41 UTC
From: root@mjbtn.MFEE.TN.US
Message-ID: <543@mjbtn.MFEE.TN.US>
Source record: 13808

I am sure most of you have heard throught some channel that IBM and Motorola (I think) have formed a company through a joint venture that is to provide computers links to laptops over the radio all across the country starting within the next year. In otherwords, you can throw your laptop in the car and it is like your using a landline modem to call in, except no landline needed. They expect it to be a $1 B$LL$ON dollar a year enterprise!!!

Well, that is all fine and dandy, but what worries me is, where is the FCC going to let them work? I mean, obviously wherever it is, not many other services could coexist with it because of the nature of data communications being often a very continous stream, and also it being susceptible to noise. I am sure they will use some sort of high speed, error free packet protcol (encrypted too).

Now IBM is *BIG* and *BAD* (sorry to you IBM lovers) and has *LOTS* of lawyers that are paid *LOTS* of money. What bothers me (and I should say that I have not heard any official announcement as to where the will operate - thus my rampant speculation) don't you think that it is entirely possible that the FCC may pull another 220 MHz/UPS stunt on us???!!! I mean - why not???!?!? My guess is that it will have to be a UHF based service with the use of digital repeaters spaced about. This could target either 70cm (420 Mhz), 33cm (902 MHz), and maybe 23cm (1240 MHz). Or maybe none of these. But the way the FCC handled the 220 MHz thing seemed to me to be special treatment to *BIG* business, and my feeling is is that here we have another similar situation.

Again, I am only *SPECULATING* as I have heard no further details. But I wanted to make sure that the group here was aware of it. In my area, 33cm and 23cm are hardly ever used ....

Anyway, think about that for awhile. If anyone gets more detailed information, I would really like to hear it. If wilderness and rain forests and elephants are disappearing for big business, why not ham radio bands????

Yours concerned,

Mark.

I have a similar situation at my location. 426 Condos all using electric heaters
in my case. Each of these heating units has a thermal relay that controls
preheating the furnace so it doesn't blow cold air when first turned on.
The thermal relays apparently get sluggish with age and start ARCing.

A 5.0KW spark gap transmitter makes a LOT of noise! I've noted the ``signals''
well into the UHF range. ;-(All I can do is pray for warmer weather. ;-)

This is just one of may possibilities ... another ``biggy'' is an arcing
power line/transformer nearby.

766. NEW ICOM IC-24 MOD !

Newsgroup: rec.ham-radio
Date: 1990-02-02 15:22:06 UTC
From: ewb@raybed2.UUCP
Message-ID: <1457@raybed2.UUCP>
Source record: 13811

NOTE: All mods done at your OWN RISK !!

Here's a useful mod for the Icom IC-24AT, the new mini dualbander.

1. Remove D13 on the main board. *

2. Reset the CPU.

Voila! The frequency range of the handie-talkie is now
75-195 MHz, 200-490 MHz, and 740-960 MHz.

* NOTE: This may void the warrantee. Make sure you treat the radio as if
it were CMOS, ie NO STATIC CHARGES.

768. Digital audio - no more QRM?

Newsgroup: rec.ham-radio
Date: 1990-02-02 15:51:19 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <02.Feb.90.16
Source record: 13812

Has anyone thought of digital audio? Now we have packet links that can
give prospectively very high data rates, it seems obvious that the possibility
of digitising audio, shipping it as a data-stream (possibly with store-and-
forward techniques) and then regenerating the audio at the receiver, is here.
OK i admit given current packet throughput on a highly congested link,
it *could* take several hours to transmit a few seconds of speech, but i
like the idea. Using the commercially available A/D and D/A converters
(as used in CD players) might be attractive. And if you used the right
sampling rates, you could record the stuff on a DAT tape.
Imagine - a 'digital audio' QSO on 20 meters, with no background QRM and
hi-fi stereo sound? (and overs that last several DAYS during bad periods :-))
Add in a video-digitiser & camera, and *see* the person you are working. Or
send a fax-QSL-card at the same time as the QSO.
Wonder which Japanese manufacturer will be the first to include *THAT*
as a marketing feature?

Source record: 13813

>I don't understand this....
>Maybe I don't understand your story.

I don't know how I could have been any clearer in what I posted... The discussion had been started on the topic of the regulations in the '34 Commo Act against the divulging to outside parties of information heard while monitoring. That is, it was perfectly legal (pre-ECPA) to listen to anything; what was prohibited was to tell anyone else what you heard.

When the Avianca jet went down, all sorts of aircraft-scanner listeners who had picked up the plane<->controller communications violated that regulation by telling news reporters the details of the conversations they had overheard. These monitors' reports of the conversations were broadcast on national news programs.

If the FCC doesn't try to enforce the "no-divulging" regulations in this instance by locating and fining the scanner monitors who violated the regs by reporting on what they had monitored, it makes a mockery of these regs, and therefore no one should ever feel bound by them or constrained by them in the future.

Another poster mentioned that he believed aircraft communications was somehow exempt from this regulartory restriction, citing the FAA practice of recording all such traffic for possible use in determining violations or reviewing incidents. I disagree with that; that example is one party or side of the communications recording the traffic. That is fundamentally different from a totally uninvolved third party (an outside listener) monitoring and then divulging the contents of that communications.

>Are there any mods that can be done to the ICOM IC32AT that will allow
>out-of-band operation? Esp. interested in extending the coverage above
>450.

I STRONGLY RECOMMEND NOT modifying radios to transmit in the public service bands. If you do have a compelling need to do so, DO NOT put it in memory (too easy to screw up). OK, lecture over, here's the mod (from the net BTW):

MODS FOR ICOM 32AT

1. Remove battery and antenna.
2. Loosen two screws on top of unit as much as possible without removing them.
3. Loosen 4 flat head screws on bottom of unit 1 turn.
4. Loosen 2 screws near PTT switch 1 turn.
5. Remove 4 black screws on back of unit.
6. Lift bottom of front cover .25 inch, slide it down .25 inch, then lift front cover up 1 inch.
7. Disconnect plug on 4 wires coming from the speaker.
<< THe flex cable can be disconnected from the main board by gently pulling up on the ears of the connector for that cable on the main board>>
8. Lay front panel on table up-side down being careful of the flex circuit.
9. All mods are done to the back of the front panel. Notice places for 5 axial diodes, which I will call 1 through 5, 1 being nearest the display.
<>
Add/remove diodes so there are diodes in positions 3 and 5. This will open up receive coverage for VHF & UHF and enable keyboard entry of the 10 MHz digit.
<< I seemed to have the same coverage with and without diode #3 installed>>

When you go out of the range the radio will receive a U appears in place of the memory channel number. It means the PLL circuit has lost lock and the radio will not work.

10. Notice 4 surface mount resistors slightly left of center directly above the speaker, lined up in a row. Solder the anode (the side without the bar) of two diodes to the right side of the lower of the four resistors.
<>
Now find the CPU. It's the PGA under the shield near the top of the board. Find the row of pins on the CPU nearest the speaker. Notice the the 8th pin from the right has a thicker trace coming from it. Now notice that there are small solder pads about .25 inch toward the speaker on both the fat trace and the two traces to the right of it. Solder one each of the cathodes of the 2 diodes to the solder pads on the two smaller traces.

This will open up the transmit for VHF & UHF.
<< Oh yes, note that memory channels clear when you do these. And the
<>

11. Put unit back together in reverse order.

This procedure worked for my unit, but I can't guarantee it will work
for yours.

<>

Last but not least to enable cross band repeating first choose a pair of
frequencies with the two vfo's for VHF and UHF.Then press and hold function
key while pressing with the other hand the following "C" "6" "D". The radio
will start scanning the two frequencies continiously, if a station is heard
in one of the two it will retransmitted from the other! The two frequencies
must be simplex, no cross band repeaters yet sorry!

WR0Y, SV1IW, N1BIP, NV7F, and N7HMF all contributed to this.

I have questions about the legality of this for some of the more legally astutue on the net. Being a student pilot, I always thought that plane-to-controller communications, although not broadcast, is publically accessable. The FAA supposedly keeps tapes to monitor what's going on. Any people that work or fly into an airport need obviously to listen to the airport frequencies, but I have never run into any "non-disclosure" kinds of paperwork.

I know many fuel stations on airports that monitor the airport frequencies to see if there are people that need fuel. Would this be illegal? Here you`re obviously using public service radio for profit (like the news).

I have always understood the airband to be public. Is this wrong?

Source record: 13825

I hope everyone realizes that all this talk about "good earth grounds"
is applicable only for lightning protection. The best ground in the
world is worthless for RF grounding at any frequency where the connecting
wire is an appreciable fraction of a wavelength long.

Like over a meter or two at 30 MHz.

Al N1AL

775. Re: ICOM IC32AT info needed

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500375@ux1.cso.uiuc.edu>
Source record: 13689

Keep in mind, however, that until the Japanese manufacturers see fit to program the CPU software to know better, the only way you can open up coverage below 440 Mhz or 438 Mhz on most UHF radios is to open up EVERYTHING (including transmit out of band and in public service bands).

So far I have found no indication that making these mods for personal use nor having and using such a radio is illegal PROVIDED that you limit your use to AMATEUR bands you are licensed for (MARS and CAP may also be legal) and RECEIVE ONLY out of band.

If you need to program a public service or other land mobile frequency in a memory, be sure to set the offset so that in case of an inadvertent transmit operation, it will at least go on an UNUSED amateur frequency.

If you are preparing for an emergency by being able to transmit on some other frequency (which I at least advise you to be fully aware of what you are doing) by all means DO NOT put the frequency in memory. DO NOT program any memory that would allow transmitting on a fire or police frequency. If your radio is stolen, you have just given a common criminal the chance to seriously interfere with public safety operations and are risking the lives of many other people in so doing.

If you must keep such a transmit frequency in memory, use a biological one.

4TH ANNUAL SOUTHWEST OHIO DIGITAL SYMPOSIUM HELD

The Fourth Annual Southwest Ohio Digital Symposium was held on Saturday, January 20 under the co-sponsorship of the Engineering Technology Department of the Middletown (Ohio) Campus of Miami University, the Middletown DIAL Radio Club, the Ohio Packet Council and the Cincinnati Buckeye Netters.

There were 114 registrants and another 30 to 40 who attended but did not register. The crowd was broken into two groups - beginners and advanced. It appears that the two were equally attended and equally appreciated.

The "Packet for Beginners" session was moderated by Carl Morgan, K8NHE, and the following talks were presented:

"Introduction to Packet" by K8NHE

"What's After 'MYCALL: NC8Q
cmd:'" by Chuck Gelm, NC8Q

"Networking for Beginners" by Phil Frazier, KA8TEF

"Basics of DX Packet Clusters" by Jay Slough, K4ZLE

"Build Your Own Computer?" by Bill Nielsen, WB4APC

"An FM Radio Designed for Digital Communications" by Phil Anderson, W0XI

"Emergency Packet Radio" by Tony Dacres, W8MDK

The "Advanced Topics" were moderated by Hank Greeb, N8XX, and included the following discussions:

"State of the Art on 446.5 MHz" by Phil Frazier, KA8TEF, and
Vic Kean, K1LT

"What's with 221.11 MHz OHIONET?" by Hank Greeb, N8XX

"TexNet/GLNET" by Jay Nugent, WB8TKL

"The Kantronics DE-56" by Karl Medcalf, WK5M

"G8BPQ PC>NODE" by Karl Medcalf, WK5M

"Update on Cellular Networking in Chicago" by Don Lemke, WB9MJN

"Emergency Packet Radio" by Tony Dacres, W8MDK

"Terminal Control Protocol/Internet Protocol (TCP/IP)"
by Gary Sanders, N8EMR

"An FM Radio Designed for Digital Communications" by Phil Anderson, W0XI

"Pushing K9NK Modems and PacComm Gear to 19.2 Kb" by Phil Frazier, KA8TEF

"Linking DX-Packet Clusters" by Jay Slough, K4ZLE

"MSYS and APLink" by Steve Wolf, NO8M

There were demonstrations of 4800-bit/s and 2400-bit/s packet radio, the new Kantronics DVR-2-2 radio, a "show and tell" about TexNet including working hardware. Terminal emulators included several PC/XTs and related devices (one of them home-brewed by WB4APC), a couple of Macintoshs, a simple video terminal and a Commodore with DIGICOM>64. Software, such as the G8BPQ code, MSYS and a variety of others, were on display, as was the HAZMAT file. Several folks brought maps of packet-radio networks of Ohio and the surrounding states. W8MDK had an extensive display of emergency uses of packet radio.

Three interesting bits of information:

1. Kantronics is in production with the DVR-2-2

2. 56-kbit/s cellular is running on a test basis in Chicago over a 30-mile path

3. Michigan seems to be moving heavily toward TexNet/GLNET, with its 9600-bit/s backbone and 1200-bit/s user access

The best news was that a whole bunch of hams sat down with diverse views and varying levels of knowledge about packet radio and calmly and rationally discussed the state of affairs of the 221.11-MHz OHIONET, and the 446.5-MHz MIDNET. No grand solutions to networking for Ohio were proposed (except for solicited plugs for TexNet by WB8TKL and for cellular networking by the contingent from Chicago). It is hoped that this spirit of cooperation continues and grows.

The organizers of the symposium wish to thank Phil Anderson, W0XI, and Karl Medcalf, WK5M, of Kantronics for their very professional presentations in duplicate and triplicate and special thanks to Carl Morgan, K8NHE, and Miami University for the use of their facilities.

from Hank Greeb, N8XX

SIX HAM SATELLITES LAUNCHED SUCCESSFULLY

On January 22 at 01:35:31 UTC, the European Space Agency (ESA) successfully launched its V35 mission, an Ariane 4 booster, from its launch facility in Kourou, French Guiana. On board were six Amateur Radio satellites, two built by the University of Surrey, UO-14 and UO-15, and four MicroSats built by AMSAT-NA, AO-16, AO-17, AO-18 and AO-19. ("UO" is the acronym for UoSAT-OSCAR and "AO" for "AMSAT-OSCAR".)

An errant tape recorder on the primary payload, SPOT-2, delayed the launch from January 9 and bad weather in the area caused a scrub of the launch on January 21. However, a picture perfect launch occurred at the beginning of the ten minute launch window on Sunday evening local time.

The AMSAT Launch Information Network Service (ALINS) brought the launch "live" to thousand of amateurs and interested on-lookers worldwide. Doug Loughmiller, KO5I, President of AMSAT-NA, anchored the net which could be heard on the ham bands covering 160 meters all the way up to Amateur Radio satellites AO-10 and AO-13. Also heard on the ALINS net were a number of the major contributors to this latest effort. Commentary prior to the launch was offered by Tom Clark, W3IWI; Jan King, W3GEY; Martin Sweeting, G3YJO; Jeff Ward, G0//K8KA; Harold Price, NK6K; Dave Cowdin, WD0/HHU; and Bob McGwier, N4HY. It was noted that this was also an anniversary for the ALINS net. Twenty years ago, the first ALINS net covered the launch of Australius-OSCAR-5.

KO5I, watching the ESA video feed of the launch, counted down to ignition and lift-off. WD0/HHU, who had been at the launch site for over five weeks, gave updates on the progress of the mission from his position at ESA mission control. At approximately three minutes into powered flight (during the second stage burn), the launch commentary ceased. For over a minute, neither WD0/HHU or W3IWI, who was monitoring the launch from the NASA Goddard Space Flight Center in Greenbelt, Maryland, offered any information. This silence certainly activated the adrenaline and stopped the breathing of those who were listening. One voice offered some comfort by explaining that ESA had never had a second stage failure in any of its missions. Finally, WD0/HHU's voice came through indicating that all systems were "still go." With that message, those listening could begin breathing again. As part of the elation felt by the development team, NK6K (a member of the software team) indicated his delight in recognizing that the satellites were no longer within the grasp of the hardware team and that the satellites were now "all theirs."

At 20:04 minutes of the mission elapsed time, ESA issued a payload separation command to its launch vehicle and UO-14 and UO-15 were freed. A minute and a half later, at 21:29 mission elapsed time, ESA issued two additional payload separation commands and AO-16, AO-17, AO-18 and AO-19 were released. WD0/HHU reported that the six separation lights were "all green" indicating confirmation that all six Amateur Radio satellites had successfully separated from the launch vehicle. He also reported that

AMSAT was treated in a most professional manner by ESA. Although the primary payload, SPOT-2, (a $100-million observation satellite) was ESA's primary concern, applause from ESA mission control could be heard over the ALINS net as the six satellites were separated from the main launch vehicle.

During the first orbit, AMSAT-LU in Buenos Aires commanded the CW beacon to begin transmitting and it provided vital temperature and battery voltage information to the satellite command team. Although attempts by N4HY to turn on the PSK telemetry beacons during orbit 1 were unsuccessful, all of the MicroSats were transmitting by the end of the last pass (orbit 3) over the west coast at approximately 0700. Spacecraft engineers NK6K and W3GEY, operating from W6TRW, indicated that the satellites had either responded to ground command or had switched on their transmitters automatically in order to prevent battery overcharging. WEBERSAT was successfully commanded on from Weber State College in Ogden, Utah during orbit 2. UO-14 and 15 were activated during the first pass (orbit 5) that was visible from the University of Surrey in the UK.

from AMSAT News Service

GATEWAY: The ARRL Packet-Radio Newsletter - - Page 3 of 4
Volume 6 - Number 10 - February 2, 1990

LISTENING TO THE UoSATS

On January 22, UO-14 and UO-15 were both successfully commanded on by the UoSAT control station in Guildford. On the 0900 UTC pass, the 435.120-MHz transmitter on UO-15 was enabled and the satellite started transmitting engineering telemetry. UO-14 was first commanded on the 1030-UTC pass. Its downlink is on 435.070 MHz. Further telemetry was received on the 1200-UTC pass. The downlinks are running at 50% duty cycle, currently 1 minute on and 1 minute off; this may be changed to 10 minutes on 10 minutes off during a later pass.

During the first days of operation, the two satellites will transmit several different data formats. These will all be asynchronous bytes sent at 1200 bit/s using AFSK FM modulation. The data can be demodulated by any UoSAT-1/2 decoder connected to a 435-MHz FM receiver. Unlike UoSAT-2, which uses ASCII characters for most of its data formats, much of the demodulated data from the new satellites will be binary and not printable ASCII. This data will be coming from one of two on-board sources: the dedicated hardware telemetry system, or the 1802 on-board computer operating system (known as the DIARY).

The dedicated hardware telemetry system is built around a custom-designed VLSI manufactured especially for the UO-14 and UO-15 satellites. This telemetry system is independent of all on-board computers and provides UoSAT engineers with a simple way to monitor the health of the satellite. Telemetry is transmitted by the VLSI system in 10-byte "packets," each beginning with the bytes FF FF (hexadecimal). The VLSI system should only be in use for a few orbits, so we will not publish the packet format at

this time; if it is used for longer than expected, more detailed information will be distributed.

The DIARY, the FORTH operating system, will allow us to begin more complex operations, such as whole-orbit-data collections, initial attitude determination and deployment of the gravity- gradient boom. The FORTH DIARY will put out printable ASCII data (including a news bulletin) along with binary data formats.

Anyone who can get a binary logs of data from UO-14 or UO-15 on IBM disks is encouraged to send them to the UoSAT Team, The University of Surrey, Guildford, Surrey, GU2 5XH, United Kingdom.

from Jeff Ward, G0/K8KA

LISTENING TO THE MICROSATS

Three of the MICROSATs, PACSAT, LUSAT and WEBERSAT, are transmitting 1200-bit/s PSK packet-radio telemetry in the 437-MHz range. LUSAT is also transmitting CW on 437.125 MHz. The fourth MICROSAT, DOVE, has a 2-meter downlink on 145.825, which later will be transmitting synthesized voice, but is now sending ordinary 1200-bit/s AFSK FM packet-radio telemetry which anyone can copy with a "stock" TNC and 2-meter FM radio. No special equipment is required!

On one pass, W3IWI was able to hear DOVE well on his HT with a rubber duckie when it was 2800 km away at approximately 5 degrees above the horizon. On the radio he normally uses for the W3IWI PBBS, DOVE is as loud as many local area packet-radio users. DOVE's 2-watt 2-meter transmitter puts out a potent signal!

All six spacecraft are in essentially the same sun synchronous orbit. In the northern hemisphere, you will get two or three evening passes in a window centered on 10 PM local time and two or three morning passes centered on 11 AM local time. All of the passes you can hear will be between plus and minus two hours from these times. Therefore, if you want to copy the packet-radio signals from DOVE flying at 800 km, just tune your 2-meter FM receiver to 145.825 MHz and leave your TNC in the monitor mode. It will transmit for a couple of minutes and then stop for 30 seconds. (To decode the telemetry from any of these satellites, watch the ALL@AMSAT packet-radio bulletins distributed by AMSAT for more details.)

And there's more to come! The Japanese plan to launch OSCAR-20 this month, and astronaut Ron Parise, WA4SIR, will have packet- radio hardware on-board the next flight of the shuttle Columbia (STS-35) in April. (If you are proud of these Amateur Radio achievements, please contact AMSAT for more information on how you can participate in these Amateur Radio space activities. AMSAT's address is PO Box 27, Washington, DC 20044.)

from Tom Clark, W3IWI

UO-15 SILENT

Nothing has been heard from UO-15 since January 22. Keplerian elements from Royal Greenwich Observatory show that the MICROSATs and UoSATs are in a small group, but one object is some five minutes ahead of the others. The UoSAT team is attempting to learn more from other radar sites.

Any accurate reports of UO-15 reception after 2330 UTC on January 22 are solicited. The nominal downlink frequency is 435.120 MHz and transmissions are at 1200-bit/s AFSK FM.

from Jeff Ward, G0/K8KA

NEW ROSE X.25 PACKET SWITCH VERSION IS AVAILABLE

The latest version of the ROSE X.25 Packet Switch (v900104) is now available. New features in this new release include the following:

o Reliable Mode for machine forwarding (aka BBS),

o Call Progress messages to let users know when the connection is complete,

o Application to provide text reason with *** Disconnect/*** Reset messages,

o Support for AEA PK87/88 and PacComm TNC-320 (VHF/HF),

o EPROM defaults now configurable in EPROM,

o Info Text can now be loaded into LOADER,

o A new application called HEARD to collect heard lists,

o Enhanced FRACK handling (needed for HF usage),

o Bug fixes for some cases when "Memory Used" creeps up.

The new ROSE code may be downloaded from the following landline systems:

PacComm BBS at 813-874-3078 (1200 baud; file area #1),

W2XQ BBS at 609-859-1910 (1200/2400 baud; packet-radio files area),

WA6RDH BBS at 916-678-1535 (1200/2400 baud),

RATS UNIX BBS at 201-387-8898 (1200 baud; login as "rats" and the follow menu).

The ROSE code file name is "RZSW0104.ZIP" and its documentation's file name is "RSWD0104.ZIP." (Both are archived using PKZIP v1.01.)

from Tom Moulton, W2VY@KD6TH.NJ.USA

PACKET-RADIO NEWSLETTERS WANTED

Your Gateway editor is collecting newsletters from packet-radio groups around the world in order to build a reference library that can be used to trace the development of amateur packet radio. Although, I already have

quite a few newsletters (thanks to TAPR President Andy Freeborn, N0/CCZ, who kindly sent me his collection), there still are a lot of holes that need filling. So, if you have packet-radio newsletters that you would like to donate to this cause, please let me know what you have (via packet radio or otherwise) and I will let you know if I need them. By the way, I don't need any old Gateways as I have the complete run.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each issue of Gateway is the Saturday preceding the issue date (which is typically a Friday).

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

From: idacrd!mac@uunet.UU.NET (Robert McGwier)
Subject: Re: DOVE fading

It is absolutely true that the antennas on all four spacecraft are from a reel of tape measure material donated to us for OSCAR 6!!!. I cut the antennas for two of the spacecraft personally. This is followed by a very professional (and expensive) coating process that makes them white on one side and black on the other so that the spacecraft are spun up.

Bob

****
Since OSCAR-6??!! And we're now up to OSCAR-19? That's what I call economy!! :-)

(Also makes it *real* easy to make sure you're cutting the right length!!)

I bought one to use with my SONY 2010. I find that it helps to get the very
weak stations, but on the stronger ones it doesn't help the clarity much.
I suppose the AGC in the radio is pretty effective and tends to even things
out a bit. I am not using mine outdoors, as these condos where I live have
a neighborhood association that regulates things like that (%*#$ totalitarians!)
I plan on moving to a real house soon (in a couple of months) and plan on
setting up some real antennage!

779. MicroSat Telemetry Decoding Programs

Newsgroup: rec.ham-radio
Date: 1990-02-03 15:27:01 UTC
From: 702WFG@SCRVMSYS.BITNET
Message-ID: <9002040802.AA11838@ucbvax.Berkeley.EDU>
Source record: 13682

Well, as is usually the case when the discussion of decoding the telemetry
from DOVE went by I watched with limited interest as I don't have the
equipment needed to do serious satelite work. But then I mentioned it
on the local repeater and now I am being deluged with requests for software
to decode the telemetry for any of the MicroSats.
So, can anyone tell me where I might be able to find any of the software
that was discused lately? I am interested in getting copies of programs
that can decode the telemetry from any of the MicroSats.

Thanks in advance.

3rd Annual Winter Listener Festival

3rd ANNUAL WINTER SWL FESTIVAL
February 23-25 1990
Holiday Inn
Sumneytown Pike
Kulpsville, Pennsylvania

The Winter SWL Festival is a good excuse for those folks with a common interest in the Shortwave Listening hobby to gather for a weekend of socializing and meeting other SWL's. Forums and roundtable discussions will be held on Saturday for those wishing to learn more about SWL'ing or to exchange tips and techniques. Door prizes, station freebies, displays from clubs, and a banquet round out the weekend events.

Forum topics:

Basic Propagation for the Beginner
QSL Preservation and the CPRV
Antennas for the Beginner and Advanced Listener
Shortwave Accessories
What are Utilities and where to start?
DXing Helps - Books, Magazines, Clubs, Newsletters, Atlases
The Collecting and Display of Station Memorabilia
The NASWA Awards Program and Tips for Acquiring Awards
Receivers: What do you need? What to look for, what is new, and what is in the future.
The Hidden World of Clandestines
What is Pirate Broadcasting and How to Hear Them.
Scanners and Scanner Clubs
QSLing Techniques
Computers and the SWL Hobby
The Role of Clubs in the SWL Hobby

Registration Options -

FULL - Includes forums, hospitality room, lunch and banquet - $30

PARTIAL - Includes forums and hospitality room but NO meals - $15

SPOUSE - Includes hospitality room and meals - $15

Please register NO LATER than February 10, 1990. Checks should be made payable to WINTER SWL FEST. Registration for hotel rooms should be made directly to the Holiday Inn at (215) 368-3800 - As soon as possible! Special rates - $55 single, $59 double. Our function code with the hotel is WINTER SWL

FEST. Please refer to this to get the special room rates. Listen to the ANARC SWL NET on 7.240 at 1500 UTC Sundays for up to the minute info.

The Holiday Inn is located at EXIT 31 of the PA Turnpike NorthEast Extension - Lansdale Interchange. Limo service is available from Phila. Intl. Airport directly to the Holiday Inn.

Please submit the following form with your registration amount to:

QST DE W1AW
ARRL BULLETIN 5 ARLB005
FROM ARRL HEADQUARTERS
NEWINGTON CT FEBRUARY 1, 1990
TO ALL RADIO AMATEURS

THE FCC HAS AMENDED ITS RULES BY EXPANDING THE SIX METER REPEATER
SUBBAND FROM 52 TO 54 MHZ TO 51 TO 54 MHZ. THIS WAS DONE TO PERMIT
THE OPERATION OF ADDITIONAL REPEATERS TO MEET THE INCREASED DEMAND
FOR SUCH OPERATION.

THE COMMISSION STATED THAT IT WAS CONFIDENT THAT VOLUNTARY BANDPLANS
WILL ASSURE THAT WEAK SIGNAL WORK IN THE DX WINDOW AND OTHER AMATEUR
USES WILL BE ADEQUATELY PROTECTED.

785. KD2BD SCA Receiver

Newsgroup: rec.ham-radio
Date: 1990-02-03 18:16:45 UTC
From: kd2bd@ka2qhd.UUCP
Message-ID: <141@ka2qhd.UUCP>
Source record: 13687
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.electronics

This is in response to the discussions concerning SCA receivers.

SCA transmissions are made on 41 KHz, 67 KHz and 92 KHz NBFM subcarriers. 41 KHz is used only when stereo transmissions are not employed. 92 KHz is a new allocation that has been available for a few years now. 67 KHz SCA subcarriers are transmitted at only 10% of the total main carrier deviation. The amplitude of the 92 KHz subcarrier (if used) is even less than 10%.

Most FM broadcast stations use SCA subcarriers to transmit limited audience programming. Programs include PRN (the Physican's Radio Network), background music (Muzak), readings for the blind, digital signals, FAX, and foreign language programming.

53 KHz carriers (19 KHz x 3) are used for the ARI traffic information system.

I designed several SCA receivers in the past ten years. My first receiver was built around an LM565 PLL working as a narrow-band FM detector. Reception was improved with the inclusion of an input amplifier and high-pass filter. Later, I obtained even better performance by replacing the input amplifier with a two-stage, discrete component, active filter. Further improvements were made with the inclusion of a carrier-operated mute (squelch) and output low-pass filtering. The mute was helpful in quieting noise when no SCA signal was present, as some stations drop their subcarriers between music selections (their subcarrier generators use "VOX-type" circuitry).

Wide-band output noise was always a problem, especially on weak signals. While this circuit worked fine living 20 miles from an broadcast transmitter, it gave poor performance when I moved 50 miles from stations carrying SCA, so I decided to tackle SCA using a different and more sophisticated approach.

My latest SCA adapter is a single conversion super heterodyne design (!!). It is a three channel receiver with AFC and a unique S/N squelch circuit.

SCA signals are first amplified by a two-section active filter, using an LF353N op-amp. The filtered signals are then routed to a carrier detector and a doubly-balanced mixer (LM1496N). An LM566 VCO supplies the local oscillator injection voltage for the mixer. The oscillator operates at 455 KHz - f and the mixer output is a standard 455 KHz narrow-band FM signal.

Output from the mixer is filtered through a single section 455 KHz ceramic filter (10 KHz bandwidth) and then fed into an MC1358/LM3065 amplifier and FM quadrature detector. The detected audio from this chip is diverted in several different directions.

First, the DC component of the detected signal is low-pass filtered and fed back to the LM566 for AFC (automatic frequency control). The output is also

fed to an active high-pass filter and detected. This DC is then differentially combined with the output of the carrier detector to yield a DC output that is proportional to the signal-to-noise ratio of the SCA subcarrier. This output then feeds a Schmitt trigger, which controls a 1N914 switching diode acting as as a series audio switch for audio muting purposes. It also drives an LED that acts as an SCA indicator light.

The purpose of the "fancy squelch" is to avoid triggering on false signals. A noise operated squelch does not work well because strong FM stations void of an SCA subcarrier might quiet the SCA detector's output enough to open the squelch. A carrier operated squelch does not work well either because weak signals might contain enough high-frequency noise that could activate the 67 KHz carrier amplifier/detector and open the squelch on pure noise.

The squelch circuit I developed works extremely well. It is very sensitive to weak signals and does not create an annoying "squelch-tail" during operation.

A three position rotary switch selects the frequency to be received. The switch controls the center frequency of the input amplifiers as well as the operating frequency of the local oscillator. The receiver tunes 67, 78 and 92 KHz. Since almost all broadcast stations transmit in stereo, I didn't include a 41 KHz position on the channel selector switch. Instead, I included 78 KHz, the subcarrier frequency used by TV SAP (second audio program) channels.

The detected SCA audio is then fed through a 7 KHz low-pass filter and made available for external audio power amplification. The entire receiver operates on 12 volts and is small enough to fit in the palm of your hand.

I recently considered trying an XR2211 PLL as an SCA detector. The XR2211 is a popular Bell 202 FSK demodulator, but it can be used for linear demodulation as well as FSK detection. Some of the advantages of this chip over an LM565 include a single ended audio output, and a PLL lock detect output suitable for driving an indicator LED and squelch circuitry.

I admit, my "super" design is a bit "robust" for SCA, but it is a design that works well. I never do anything the "easy way" anyway. :-)
It is the result of many years of "tinkering", and I have been able to use some of the concepts developed here in other projects as well.

I hope the information contained here might help others interested in SCA reception and subcarrier FM receiver design.

I am thinking of doing a SCA decoder using the MC3357. Is there any
mail order source for small quantities of muRata, Kyocera, or Toko
455 Khz ceramic IF filters?

Pete_Simpson@DGC.MCEO.DG.COM writes:

>I've built the same NE565 demodulator from the same
>Signetics application note

It may be you built a different circuit than I did... mine is from the 565 data sheet published in the back of "Design of Phase-Locked Loop Circuits," by Howard M. Berlin (Sams), rather than from an application note.

I've about given up on the circuit; I ordered a commercially-available one last week, but spent all day today still trying to get the 565-based one working. Maybe after I get the commercial one working I can test the 565-based one against a station I'm sure has an SCA program on it.

So far I've received a lot of requests to be informed if I find out what is wrong, but only one specific suggestion of what might be wrong with this circuit, from someone on the Prodigy Service's "Amateur Radio" bulletin board. His message says:

First, the data sheet is WRONG! There has been an error in it
for about 10 years, and they have NEVER fixed it. I don't have
it here, but a friend does, and I will contact him in the next
few days and get a fix. They have a resistor misplaced as I
recall, and it knocks out the 63 KHz subcarrier to a really low
level.

Second, almost all modern radios (those single IC jobs) get FM
in one end, and have a 70 KHz IF, not 10.5 MHz like the "bad
old days". You can't get SCA off a radio like this, so you have
to prowl the Goodwill for somebody's old junk tube or transistor
clock radio.

I haven't received the corrected circuit yet.

I did try amplifying the signal before it goes into the demodulator using a LM318 op amp, but it didn't help -- nothing comes out the filter network the precedes the 565. I also tried building a "fourth order active high pass filter" from Lancaster's "Active Filter Cookbook" and replaced the network with that, but that didn't work either, so it may be something else... though debugging the demodulator and filter at the same time make it harder to see what's not working. With the commercial circuit I can test the filter separately with a known-good demodulator.

I couldn't figure out if the article was supposed to answer the question, or was asking "where's this place the story's about". Burkina Fasso is at 0W 13N and thereabouts, and is surrounded by Mali, Niger, Benin, Togo, Ghana, and Ivory Coast. The population is 8,365,000; the capital is Ouagadougou. The life expectancy there is 47 (F), 44 (M) and it has a 9% literacy rate. It gained independence in 1960, and had coups in 1966, 1980, 1982, and 1983. The name was changed to Burkina Fasso in 1984.

SpaceNews
=========

MONDAY FEBRUARY 5, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED distribution.

* UoSAT-OSCAR-14 NEWS *
=======================
The FORTH Diary software is in operation on UO-14, as programmers MS Hodgart and MLJ Meerman (G0/PA3BHF) ground-test new attitude-determination and control software prior to re-loading the OBC.

The standard UoSAT ASCII whole-orbit data (WOD) format has been added to the DIARY's downlink schedule, and new WOD surveys have been conducted daily. Stations with UoSAT-2 decoders and WOD collection software should be able to decode these surveys without difficulty. The surveys which have been transmitted in ASCII so far are a survey of the magnetometer channels (22, 23 and 24 starting at 21:54 on 26 January), and a survey of the PACSAT Communications Experiment 80C186 CPU temperature and current consumption (channels 5 and 44, starting 11:45 on 27 January). The very beginning of the PCE survey clearly shows the 10-degree increase in CPU temperature which occurs when the 80C186 is turned on.

* UoSAT-OSCAR-15 NEWS *
=======================
Nothing has been heard from UO-15 since 22 January. Tracking stations and amateur listeners have determined that the object "out ahead" of the Microsat cluster is not UO-15, but the spent Ariane third stage. The object trailing the pack is SPOT-2, which has been raised to a slightly higher orbit and so has lower mean motion than the other satellites.

Accurate reports of UoSAT-OSCAR-15 reception after 2330 UTC on 22 January are desperately needed. The nominal downlink frequency is 435.120 MHz, and transmissions are at 1200 bits/second AFSK-FM.

[Story by G0/K8KA]

* MUSES-A LAUNCH *
==================
MUSES-A was launched on 24-Jan-90 at 20:46 JST (=UT+9h) from Kagoshima Space Center. The satellite was nicknamed as 'HITEN', which means guardians, living

in heavens, of Buddah, after putting it into the planned orbit.

MUSES-A is a lunar satellite and will make the first lunar flyby on 19Mar90 at 05:30 JST, when it will come within 18,000 km of the lunar surface. Just before the flyby, a lunar orbiter will be deployed. A second lunar encounter is expected to occur on 10Jul90.

NASDA postponed the launch of MOS-1b until 07-Feb-90, due to a needed replacement of an electronic device used to control the launcher's second stage.

[From: Yoshiro Yamada of the Yokohama Science Center, Japan]

* SHUTTLE NEWS *
================
Launch of Atlantis and the STS-36 mission is scheduled for later this month. A Terminal Countdown Demonstration Test was conducted with the STS-36 crew from 02Feb90 through 03Feb90 in preparation for the shuttle launch.

>I would like to know how good is the AN-1 antenna for the SONY-2010.
>Is it any better than the wire antenna provided with the set.

I have both a Sony AN-1 and a Datong AD-370. The AN-1 is a nice antenna
for use with a portable radio -- it comes with adapters to fit various
kinds of portable radios, and it has relatively limited amplification to
avoid overloading the receiver. It also looks very nice, and comes with
a mounting bracket that can be installed a variety of different ways.

It is nowhere near as sensitive as the AD-370, though. The drawback
to the AD-370 is that it will overload small portable radios (but it
has a button to turn off the preamplifier in that case).

Overall I think the AN-1 is well-optimized to small portables, and is
certainly a lot better than a wire antenna, at least for limited-space use.

I did this (add a stub filter) to keep my packet xmitter out of the TV. What I did was take a pair of chassis-mount f-connectors and solder them back-to-back. And I soldered a length of RG59 to this midpoint to make the stub. Them I took it to work where I borrowed a specrum analyzer to nibble the length to make the notch at the right freq. Then I taped up the joint to keep it from comming apart.

Hope this helps WA2ISE

[where will they operate?]

Well considering that IBM is using Motorola-built RF terminals here
in Atlanta for all their service people and considering that it
now operates in the 800 mhz band, it would seem quite likely that
our 903 allocation would be a good target (no :-))

794. alternatives to RS DX-440?

Newsgroup: rec.ham-radio
Date: 1990-02-04 09:37:58 UTC
From: gst@spdcc.COM
Message-ID: <1515@ursa-major.SPDCC.COM>
Source record: 13696
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Sorry if this question has been asked before. I just purchased a Radio Shark DX-440 to pick up the series on the environment being aired by CBC, which Robert Horwitz alerted us to back on 15 January (thanks, sir!). Not knowing anything about current technology (my last experience with shortwave was when I assembled a Heathkit receiver (with tubes!) 25 years ago as a teenager (guess that kinda dates me :-), I just let the guy behind the counter talk me into their DX-440. He claimed it was rated just below the Sony (2010?) receiver in a recent review.

My questions are:

1. How good is it? Is it worth the $200 I paid for it? What are the alternatives in its price range, and their advantages?

2. I'd like to tape from the receiver. The only audio output is the headphone jack. The RS guy sold me an "attenuating patch cord" and an RCA adaptor. Do other models have an RCA jack with the proper level for direct input to a tape deck or amp? Despite the fact that the output level from the headphone jack is higher than the standard preamp-level output, I find that I have to crank the input controls to my tape deck way up to get a decent signal. Why is this?

3. I just spotted the article about the new IRCOM unit. I note that it has *lots* of memory cells (the DX-440 has only nine). How much does the IRCOM model cost? If it's a lot more than $200, does it seem worth the extra money?

4. Anything else you'd like to say on the subject?

I have 30 days to make up my mind on whether I want to keep the thing, so I'd appreciate comments in that time period. I haven't been a regular reader of this newsgroup, but will become one during at least the next few weeks in order to collect replies (and learn something about this fascinating subject). I'll also summarize any emailed replies I receive.

Thanks in advance for any advice!

BTW, while listening to Radio Canada International tonight, I heard a review of the "Grundig Satellite 500." They said the unit they just tested, from a late production run, was much better than an earlier one - mostly in terms of sensitivity, I think, but they said the batteries have a tendency to slide around inside, and can lose contact with the terminals, due to their weight when the radio is in whatever orientation causes said batteries to assume a vertical position, resulting in a loss of power (sloppy!), and that they were unable to easily correct

the problem. Back to the drawing board, guys...

795. More on Digital Voice Recording...

Newsgroup: rec.ham-radio
Date: 1990-02-04 14:25:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9002050802.AA23098@ucbvax.Berkeley.EDU>
Source record: 13700

I recently bought a device which allows one to record up to 16 seconds
of voice onto a chip. It is a self contained unit, with a condensor mic,
speaker and battery holder (4 AA's). One simply presses one button to
record and another button to replay. The unit has 256k of RAM built into the
chip. Audio quality is okay for the phone at 16 seconds and extremely good at
6 seconds...it's minimum time (sampling speed is adjustable). The unit I bought
costs 50 dollars locally, however it should be much less in the U.S.
The unit is called "Digi-Memo" and is made by "Conrad Electronics" GmbH, 8452
Hiirschau, West Germany.

A perfect use for such a device is a voice ID on a repeater or with a simple
555 circuit - it can be configured to call CQ automatically while you sit back
and relax.

Hard to believe that the ARRL is still printing that article in the Handbook
about how to burn in an EPROM as a CW ID'er for a repeater when these things
are around. On the other hand, all commercial and public service repeaters
still use CW as a means of ID'ing so maybe there's something to CW after all !

I wish there was a similar device that did the same thing - only with the
option to let the user determine how much memory he wishes to use. If the user
wants more recording time he simply would plug in some more EPROM.
If anyone knows of such a device...please let me know.

In the same vein, I heard some activity on 10.9m (27525 kHz) in both
AM and USB on the same frequency. The USB guys and AMs (they called
themselves CJers ???) were having a major war on that frequency, with
pretty foul language by the "sidebanders" including attempts to
sabotage the AM txm. It seemed pretty odd to me. I hope this won't
start a flame war, but can anyone tell me what band this is and
if it is legal for such language to be used over the airwaves?

It appears to be just outside the AM CB band, unless now it is part
of that band. Comments welcome. BTW, the AM signals were just booming
on my Sony 2010 and it originated just west of the Rockies.

>mail order source for small quantities of muRata, Kyocera, or Toko
>455 Khz ceramic IF filters?

Digi-key Corp. (1-800-344-4539) has one 455 kHz Toko (listed under "FM Ceramic Filters" :-) ceramic filter in their catalog. Yes, up-converting the SCA signal from the demodulated output of an FM broadcast receiver to the 455 kHz area and FM/FSK demoding the SCA there should give you something very usable. You may have to provide a tunable L.O., since the different SCA carriers in use are spread out quite a bit more than the 455 kHz filters would let through.

I am pretty satisfied with Digi-key. I did a small-quantity order from Digi-key just not too long ago.

For a high-price spread, how about using a Collins mechanical filter? :-) (Or a circa-1965 Lafayette Radio 455 kHz mechanical filter, if you can find that in your junk box :-)

For those still curious about SCA transmissions - I believe Bob Parnass has mentioned this a little while back - take the tape-recorder output of an Icom R-7000; inject that into an Icom R-71a's low-frequency-antenna spigot. Use the Parnass-hack (go Boilermakers!) to trick the R-71a into tuning down to the SCA carrier frequency. Switch the R-71a to FM (assuming that you have that option installed), and voila, you have an SCA system that sounds as clean as anything else I have heard through SCA.

Now try this - I think that it would be even better the above, since I have never found the FM demodulator option for R-71a to be all that great. Take the (70 MHz?) IF output of the R-71a and pass that to yet another R-7000 tuned to 70MHz, with the NBFM demod. I don't want to even *think* about the number of upconversions and downconversions in this chain before the signal finally comes out the AF faucet! Never had a second R-7000 to try it out, though :-).

Oh heck, why don't one simply take a doubly-balanced mixer and a ~144 MHz L.O., and beat the SCA up to 2m and pipe that into your H.T.'s NBFM receiver. (Use a second H.T. for the L.O, tapping a dummy load so you won't blow up your mixer, HI HI.)

Have fun!

799. European TV frequency allocation

Newsgroup: rec.ham-radio
Date: 1990-02-04 20:47:05 UTC
From: avip@iilcad.intel.COM
Message-ID: <9002042047.AA23111@iilcad>
Source record: 13713

Commercial TV broadcasting in Europe/Middle East follows a different frequency allocation scheme than in the U.S. Frequencies are organized in three bands: Low VHF (Channels 2,3,4) Hi-VHF (Channels 5-11) and UHF (Channels 21 to 90something).

May anybody on the net provide me a detailed frequency table for the above channel scheme. i.e. which frequency in Mhz belongs to each channel,etc.

I'm aware that the generic term "Europe" is a bit vague, considering the large variety of TV standards coexisting there. I'm specifically interested in the frequency table for countries using PAL/SECAM standards.

Thanks in advance!!

|>This is a clear and explicit violation of the law. If the FCC doesn't
|>do anything in this case, then everyone should consider the law
|>meaningless and ignore it from now on.

|I don't understand this. Are you saying it's illegal to listen in to
|aviation frequencies? If so, there are a hell of a lot of paper outlaws
|around. (Since when is that new; 55mph speed limit, etc. etc.)

No, it is not illegal to listen. It is, however, illegal to tell anyone
else what you listened to or what you heard. It is also illegal to use
any information you heard for your own gain. That section is called
"The Secrecy of Communications act/section," if memory serves. You
can listen, but you must keep it a secret unless the communications
in question is from you, to you, transmitted by stations in distress,
transmitted by stations reacting to a station in distress, transmitted
by a broadcasting station, a CB station, or an Amateur station.

802. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-02-05 06:13:14 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9002050803.AA23235@ucbvax.Berkeley.EDU>
Source record: 13716

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

803. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-02-05 06:13:33 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9002050804.AA23346@ucbvax.Berkeley.EDU>
Source record: 13722

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

>Stuff about monitoring other communications and divulging info (deleted)

I understand what you are talking about in terms of the Avianca Jet
crash scanner listeners, but what about the "Traffic Update"
companies that seem to be everywhere on the radio (AM/FM). (Atleast
in the big cities like LA, San Diego, NY, SF and others. I am sure
there are more though)
They always have a scanner in the background when they give their
traffice reports and I am pretty sure that they
are not getting all of their information from the "air" traffic
reports. I wonder if there is something illegal about that?

I do like california's scanner law though which says you can listen
all you want as long as you dont tell the person who the police are
after what the police are up to. Could this be in conflict also?

I headed out to the local Sears store last week and bought a cellular mobile phone for $199.95. The phone can be permanently installed (optional brackets) or left in the really nice Cordura bag you get with it and it comes with a suction cup antenna to put on a window. There is no access charge for service, just a guarantee of at least $10/month airtime usage. And then Sears takes $50 off your first month's bill! (Hmmmm- $10/mo and no-one to scrutinize my every call. Repeater club dues alone are $25/yr. Think about it!)

The point of my posting is this - I can purchase a 900MHz phone for $200 or a synthesized marine radio for $160 or a CB for $40. You can't touch a 2M rig for under $250 and the dual-bander prices are truly astronomical. Where is all that ham ingenuity? What can we do with these reasonably priced consumer radios? If you know, please post to the net. My intention is not to start some cosmological discussion of "Why I need to be a ham".

The World Radio TV Handbook used to, and I assume still does, list
the frequencies of TV channels throughout the world. Both video
and audio center freqs are listed along with bandwidths,
separation, etc. I can try to dig out the info if you wish. Be
advised that British, French, Italian, PAL, and SECAM are all different
(I think).

Radio Shack sells a little portable alarm clock that has a switch on the back for 12 or 24 hour format. I bought it about 10 years ago and I haven't had to change the hearing-aid sized battery yet!
I paid about $8.00 for it then. It has an LCD readout with characters about a half inch tall.

S T R A N G E 7 8 5 0 P R O B L E M ! ! !

While we're on the subject of Kenwood 78xx's, I've got a 7850 that
has a strange problem that someone in netland might have seen...

Occasionally, the audio on the 7850 suddenly drops to near-zero
volume. Cranking the volume control has no effect on the output
level. Turning the rig off and back on usually (90%) fixes the
problem. Since turning the volume control doesn't seem to fix
it (other than turning it clear to off), I assume that it isn't
as simple as a dirty wiper on the volume pot. Suggestions? HELP!

813. SCA - not as easy as it seems

Newsgroup: rec.ham-radio
Date: 1990-02-05 19:19:42 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <9002051919.AR00038@adam.DG.COM>
Source record: 13717

CEO file contents:
The saga of the 565 SCA decoder continues...

I just looked at the Signetics app note and it looks
as if there may be a bug. At least, it would seem that the circuit is
drawn incorrectly to do what they say it does. Here's the input
circuit as it appears in the app note (AN184) in the Signetics 1987
Linear Data Manual, Vol 1, Communications, fig. 4, "SCA Decoder,
p. 4-303:

```
+Vcc
|
|
10K ___________
| |
| |
DEM FM o---+--510pf-|---+----510pf----|2 IN+
| | | |
| | 4.7K | NE565
4.7K | | |
| +---+----4.7K-----|3 IN-
| | |
| 4.7K |
| | |
+--------+-----------------|1 GND
|___________
```

I believe the above circuit is WRONG. In the same data book, the data
sheet for the NE/SE565 has *almost* the same circuit (fig. 5, p.
4-296):

```
+Vcc
|
|
10K ___________
| |
| |
DEM FM o---510pf--+--510pf-|---+-------------|2 IN+
| | | |
| | 4.7K | NE565
4.7K | | |
| +---+----4.7K-----|3 IN-
| | |
| 4.7K |
| | |
```

+--------+-----------------|1 GND
|__________

Let me explain why I think the above circuit (which is the one
I think I built) should work while the other should not. The two 510pf
caps and the leftmost 4.7K resistor are a high-pass filter (I think).
The vertical 10K and 4.7K are the voltage divider which sets the
input bias to VCC/3. The last two 4.7K resistors add the bias voltage
to the input signal and the pin 3 input.

This matches with what they say in the circuit description on
page 4-295:

"This circuit also serves as an example of operation
from a single power supply.

A resistive voltage divider is used to establish a bias
voltage for the input (pins 2 and 3). The demodulated
(multiplex) FM signal is fed to the input through a two-
stage high-pass filter, both to effect capacitive coupling
and to attenuate the strong signal of the regular channel.
A total [SCA] signal amplitude, between 80mv and 300mv, is
required at the [DEMOD FM] input."

I think I'll try building this at home & if I'm wrong, I'll be the
first to admit it!

Sometimes you may be able to easily modify a 12 hour clock to 24 hour format. It all depends what chip the clock-radio (or whatever) uses. Many chips can be switched from one format to another by disconnecting a pin from ground to +, or the other way around. Look up the chip number in a databook, and see if it has this feature. Be careful, some chips have 3 choices: 24hr at 50Hz, 12hr at 50Hz, or 12 hr at 60Hz. no 24hr at 60Hz. Bah! Also, the display may not support the 2 in the first digit. But it's worth a quick look at.

817. 10.9 meters

Newsgroup: rec.ham-radio
Date: 1990-02-05 22:53:14 UTC
From: sorgatz@ttidca.TTI.COM
Message-ID: <9562@ttidca.TTI.COM>
Source record: 13721

In article <4181@helios.TAMU.EDU> narayan@photon.UUCP (Sriram Narayan) writes:
+
+...I heard some activity on 10.9m (27525 kHz) in both
+AM and USB on the same frequency. The USB guys and AMs (they called
+themselves CJers ???) were having a major war on that frequency, with
+*pretty* foul language by the "sidebanders" including attempts to
+sabotage the AM txm. It seemed pretty odd to me. I hope this won't
+start a flame war, but can anyone tell me what band this is and
+if it is legal for such language to be used over the airwaves?
+

The Class D 11 meters, Citizen's Radio Service occupies the band of freqs between 26.965 and 27.405. There are some skips in the 10KHz channel spacing to permit the use of low-cost radio control devices, but that aside, operation outside this band is simply illegal.

+It appears to be just outside the AM CB band, unless now it is part
+of that band. Comments welcome. BTW, the AM signals were just booming

AM or SSB, makes no difference. The FCC's recommendation was that mode-use would be dictated by 'local convention' and 'majority use'. Pretty dumb, if you ask me, the point being: THERE ARE NO CB STATIONS THAT MAY LEGALLY USE FREQUENCIES ABOVE 27.405 MHZ !! These people are in clear violation of both the letter of the law as well it's spirit. That the FCC has not busted them yet is no letter of the sanctity in their operations..and the situation is quite likely to change in the very near future!

You will find bootleggers illegally using frequencies between 27.405 and 28.0 MHz and sometimes, you will even hear them attempting to invade the Amateur allocation of 28.0-29.7 MHz. They are easy to spot: no ID every 10 minutes, Hams are required to do this and take great pains to comply. Bootleggers will typically SOUND like CBers, using gutteral language and repeated catch-phrases, like: "NO DOUBT ABOUT IT!" "10-4!" and the like.

What you've been listening to, OM, is an example of the worst that radio has to offer; complete havoc. No licenses, no rules, no morals, and damn little real interest by the parties involved in learning about the Science of Radio...I recommend you tune upward on your dial...towards 28.3-28.5MHz. This is where Novice/Tech 10 meter voice operation is found.

You'll hear a large number of people having a swell time experimenting with converted CB radios, trick-antennas, tuners, grounds -- loads of Novice ops, as well as all other classes of Amateur operators..sharing the fun and helping each other grow..a great time, 10 meters is enjoying enhanced DX with the sunspot cycle now near it's peak. Maybe you'll even

get the urge to become licensed and join in the fun! Your own callsign! (It's a bigger thrill than most hams will admit!) The day it arrives, you go a little crazy...you dash to the rig and begin working your fellow Hams with a fever! It's a mega-dose of the thrill in hearing rare-DX, mixed with the joy of passing a tough test, and a hint of sex..all rolled into one!

Amateur Radio awaits you...join us!
'73!

818. Call for Discussion: rec.radio.misc

Newsgroup: rec.ham-radio
Date: 1990-02-05 23:38:19 UTC
From: welty@lewis.crd.ge.com
Message-ID: <2843249899@lewis.crd.ge.com>
Source record: 13723
Cross-posted to: news.announce.newgroups,rec.misc,rec.radio.shortwave,rec.ham-radio

Call for Discussion: rec.radio.misc

this is by way of formalizing things ...

we now have the beginnings of a rec.radio.* hierarchy; we do not, however, have a misc group. the absence of a misc group has a number of negative effects:

everybody wants a niche group created even though traffic can't be shown

inappropriate traffic bubbles up in the existing niche groups

potentially reasonable radio discussions are orphaned

i am proposing that rec.radio.misc be created, to provide a home for various topics such as radio programming, radio listening, etc. this group would give readers of rec.ham-radio.* and rec.radio.shortwave a place to point at for inappropriate articles, as well. in general, it seems a good way to vent off unproven niche-radio group proposals: ``why not use rec.radio.misc for a while and see if it flies''.

discussion will go on at least until after i finish counting votes for soc.history; i'm not inclined to collect votes on two proposals at once. discussion should go on ONLY in news.groups, which is where followups to this article are directed.

cheers,
richard

Tad, I have do disagree with you here calling it a "trivial clerical skill".

Can you play a musical instrument? Do you know anyone who CAN'T? Granted, with hours of practice and coaching by someone, anyone CAN INDEED LEARN TO MAKE AN INSTRUMENT PRODUCE SOMETHING SIMILAR TO MUSIC. But I don't think it is trivial.

Can you juggle? I cannot. I've tried a few times and practiced and practiced, but my FRUSTRATION LEVEL overcomes my PERSISTANCE before long. *I* don't think it is trivial.

IMHO, learning the code is similar. I know ANYONE can do it because *I* did it. I failed the 13 wpm half a dozen times before finally passing it while a junior in high school. And oddly enough, I enjoy a CW rag chew now and again, God help me! But it isn't my main interest in Amateur Radio. I just wanted the license badly enough to do it. And I don't think it was trivial.

I've been teaching code for about a year now, at several levels. We have a session Every Thursday Night and whoever needs practice at whatever speed, that's what we do. Some nights we go from 3 to 23 wpm.

I am here to tell you that it is absolutely easier for some people to learn the code than for others. I can also testify that there is no short cut. It takes PRACTICE. If someone practices every day for twenty minutes or so, they'll learn the code. If they practice every other day they'll take longer.

"Time to devote to amateur radio" cannot always be a scheduled thing. If you can devote 5-to-6 hours per week to radio EVERY WEEK you are indeed fortunate. Some people have work and family priorities.

But Time To Devote To Code Practice *MUST* be scheduled and regular if you are going to make progress before you lose interest due to frustration.

Believe me, it isn't trivial. Maybe for a clever 12-year old, but not for the average adult.

I have mixed feelings about NO-CODE. I believe it will happen, not this year or next, but soon. If those interested keep at it. If that's the case, then,

it's time for it.

But down-deep I have a totally illogical, emotional feeling of "Shut up and learn the @#^&%$ code!" This is based in years (as for you) of having had that odd language as a part of me. I hear code in places where there is none--like a car horn sending an R or a train whistle sending a Q.

No Code is coming. I think it has to. As I say, I have mixed feelings about it. But in the meantime I do all I can to help those who WANT to overcome the obstacle. And I offer words of encouragement to those who do not.

Tad, please don't consider this a FLAME, just a BLAST OF HOT AIR... a gentle disagreement with one statement you made.

Regards,
Bob WA8YCD

Does anyone in net land have information on how to modify the Kenwood TS-940S HF transceiver to transmit out of band?

Greg, AA6BO

P.S. By now I don't think it's necessary to enumerate all the legitimate reasons for desiring the capability to generate signals at frequencies that are outside of the ham bands. I do not intend to transmit outside of the ham bands without a license.

822. Current information about becoming involved with amateur radio?

Newsgroup: rec.ham-radio
Date: 1990-02-06 01:14:39 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Feb6.011439.26423@NCoast.ORG>
Source record: 13627

Twelve years after I first learned about amateur radio, the bug has tickled me again... and I'm now (almost) in a position to do something about it. Unfortunately, the most recent information I have about FCC testing centers, requirements, etc. dates from the 60s (from my father's stuff; he isn't a ham, but had a friend who was (is?)). Can someone email me either or both of:

(a) An address to write to at the FCC for current information, including the locations of testing centers, current rules for amateur radio classes, applicable regulations, etc.

(b) Addresses of subscription departments for amateur radio magazines and/or other sources.

I'd also appreciate a little advice about how best to go about this, given that I live in an apartment and the landlord doesn't seem to happy even about the simple longwire I had up over the weekend for SWL'ing; I suspect I'm going to be stuck with some kind of mobile operation, but (again) my knowledge of *that* is state-of-the-art for 1965 or thereabouts....

Thanks in advance,

823. Amateur Television in Europe

Newsgroup: rec.ham-radio
Date: 1990-02-06 01:44:03 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500378@ux1.cso.uiuc.edu>
Source record: 13628

What kinds of Amateur Television transmissions take place outside of the United States? I would assume you would normally use the standard TV system of your home country. For those of you in Britain or France, does anyone use the older black and white standards (405 line or 819 line) TV standards? Is it even legal? For anywhere in Europe, do hams transmit the opposite color standard of their home country in order to reach other countries (e.g. transmit SECAM from West Germany or PAL from France)? Is this legal to do? How about NTSC or PAL-M on a 525/60 system?

I understand for the most part, 23 cm is the only practical ATV band in Europe (with only 12 Mhz of space above 6 meters and below 23 cm things are more crowded than in the USA).

In the USA, no rules exist the specify the television standard except for when the station identification is given in video only in which case a reference to technical specifications from the broadcasting rules is used.

N4XHX was speculating where in the spectrum the new Motorola/IBM data network might operate. As I recall, they are already operating in the 800 or 900 MHz area for the IBM field service forces. The articles I have seen in the Wall Street Journal all mentioned that they were going to use existing IBM facilities and a nationwide "network of towers" already in place, so I assume that is where they will continue to operate. Of course, if the service proves popular, and starts generating the billion$ that they are projecting, who knows what spectrum they might gobble up!

826. 66-88MHz coverage on scanners.

Newsgroup: rec.ham-radio
Date: 1990-02-06 10:44:03 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <06.Feb.90.10
Source record: 13631

In INFO-HAMS Digest V90 #135, RICHARD DALE comments:
>
>5. Remove diode from "D-45" to restore coverage from 68 to 88MHz.
>---
>In step 5 above, I have no idea what this is for.
>

Explanation: 68-88MHz is used in Western Europe for mobile radio.

Since Europe was the home of broadcast TV in the 1930's, and technology was at the time not too hot, the band 41-68MHz was initially used for TV. This was known as 'Band 1'. There were various standards, offsets etc. used. It gave 3 or 4 channels, 405 lines, monochrome. Not bad for 1936, using five-inch circular screens and simple dipole antennas.
Most of this network has now closed down, as has the 'Band 3' TV network (174-216MHz). The majority of European TV is now in the UHF band (470-860MHz), usually using 625 lines (color). This band is badly congested, so satellite TV (ASTRA, BSB, Sky-TV) is being introduced.
Mobile radio (using trunked digital technology) is being established in the old bands 1 and 3. UK Hams have also been allocated a slice at 50MHz so we can work Stateside. The same has happened in parts of France & also i beleive in Norway.
Theres a 'low power, anything goes' segment around 46 and 49MHz for the cordless-phone/garage-door-opener/baby-listener/radio-toy fraternity.
68-88MHz was the only section free, post-WWII, for the emerging mobile radio industry to operate in. Police, ambulances, fire, local utility & taxi despatchers etc. had nowhere else to go. They are still there.
Incidentally, there is, in Britain, a ham band 70.000 to 70.500MHz. This is also valid for some British ex-colonial outposts (Gibraltar, Cyprus).

Thus the 68-88MHz range is mandatory on any scanner that wishes to be taken seriously in Europe. The 30-50MHz range is no use to us. (largely silent, or full of digital squawks). Similarly, much use is still made of AM by the European mobile radio business. Makers of scanners with selection of AM possible *only* in the air-band please take note!

Why is it that some people think that when you "learn the code"
it stays learned??? Did you never, ever study for a final,
take the test, and promptly FORGET how to even spell the subject
of the course??? If you are like most people you have done that.

THAT IS HOW I LEARNED THE CODE!!!

I learned it solidly, took the test, and immediately tried to
garbage-collect the neurons before they were hopelessly lost.

So, I have a license which requires code, but I am doing well to
recognize /RPT at the end of repeater IDs (only because you already
know it!) and I might could send my call.

I bring this up because I grow weary of all those people saying
how wonderful and uplifting it is to learn the code, how it makes
you a better person, and "builds strong bodies 12 ways."

So, I'm a 97-pound weakling in the code category, but that doesn't stop
me from working on TCP/IP and spread spectrum modulation.

From: ewb@raybed2.UUCP
Message-ID: <1460@raybed2.UUCP>
Source record: 13633

The mods posted for the IC-24 enable the wide receive only (as far as I know). However, the good news is that there are more mods on the way such as direct entry of MHz when out of band. BTW the out-of-band sensitivity is very good (blew the doors off a BC-200xlt), except near the ends of the range.

The subject of "mod's" for the IC-04AT have probably been brought up before here on the NET, but for some reason I have managed to miss them all. So, if some kind ol radio amateur could dig in to his or her files one more time, and post them for me, it would be muchly apprieciated. I am specifically looking for the mod's that pertain to out of band operation, and RX audio volume improvement.

Please post or e-mail, and thanks.

Has anyone actually tried this, and did it work? What is your serial
number?

I bought my 24AT last weekend and it's great. I recommend replacing the
antenna with one from a 32AT - several S-units better on 2 meter receive.
It doesn't do crossband repeater as-is, but there may be mods for this.
It does do crossband full duplex. I'm used to Kenwood products, so the
labeling and key sequences seem a little convoluted, but I'm rapidly
adapting. As-is, XMT/RCV 140-150, 440-450, and RCV only 138-174. Almost
everything with the radio is programmable, separately if it is unique to
a band (duplex offset, band scan limits, freq step, etc.). A full-featured
micro dual-bander.

I received the following mods for 24AT out-of-band from a very reliable
source (although they don't specify RX only or RX/TX), for 75-195 MHz,
200-490 MHz, and 740-960 MHz. Rumor has it (unconfirmed) that the unit
even switches to AM in the air band!

1. Remove diode D8 [see figure below]

2. Attach diode D7 [I believe this is already equipped]

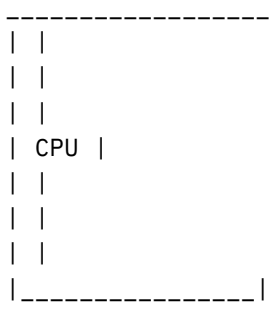
3. Attach diode D12

4. Remove diode D13

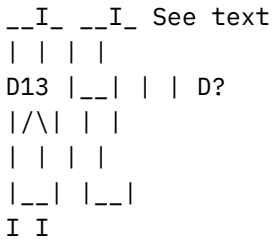
5. Simultaneously hold "LIGHT", "B", and "#" keys and turn the
power on. Release all keys after the display goes out (checks
all LCD segments). [This is supposed to enable the
out-of-band frequencies above]

6. Simultaneously hold "LIGHT" and "2" keys and turn the
power on. This enables the 10 MHz frequency digit entry.

7. Simultaneously hold "LIGHT" and "3" keys and turn the
power on. This enables the 100 MHz frequency digit entry.



o o o D7 lower left pin is
[D7] [D8] anode of one diode,
o o o lower right is cathode
of the other. Top pin
o o is common
[D12]
o D12 upper pins are cath-
odes of diodes, lower
is common anode.



WARNING: I have NOT tried the hardware mods and cannot vouch for them, so
proceed at your own risk!

I am told that the newer 24AT's (believed not to have made it to the US
yet) will have the hardware mods in place, so only steps 5-7 will be
necessary. So, try this first. Steps 5-7 don't seem to have any effect
on a 24AT without the correct hardware mods. BTW, this has been attempted
on 2 units with serial numbers around 1000 and mid-1100's, neither of which
worked. :-(Like I said, the ones with the mods aren't here yet.

There are 5 screws to remove the case (5th is on the strap hook). Keep
the top panel controls with the front of the radio, and be VERY careful
pulling the back off because there are fine ribbon cables connecting the
front & back. I don't think they'll take much flexing.

Additionally, diodes D7, D8, and D12 are surface mount components. They contain 2 diodes connected to 3 pins. Diodes D7 and D12 are different configurations. I believe D8 and D12 are different, so I wouldn't put the removed D8 in the spot for D12. Since they are surface mount, removal of D8 may not be all that difficult for those with steady hands and a fine low power soldering iron, but adding D12 would be a bear. I know of no reason that small discrete diodes couldn't be used in for D12. D13 is a small but standard axial diode, and can be easily cut.

It is for this reason I have not attempted the hardware mods. Now, if the referenced posting is correct, and only D13 needs to be cut... I'm guessing, but it could be that the rest of the diode changes are for the 10 MHz & 100 MHz digit entry (which I'd like but could live without) or out-of-band TX, or the like.

If anyone has tried only cutting D13 and resetting? Did it work? What is your serial number? Please post to the net!

If I learn more, I'll follow up.

> What is the TRANSMIT range when the mods are done to the IC-24AT?

Transmit range doesn't appear to be affected unfortunately. I was at least hoping for 420-450 coverage. BTW, I tried each amateur band from 6m to 23cm. The PLL doesn't lock up at either end. Another negative is the frequency step on 220 doesn't allow one to hit each possible repeater slot.

All in all, not too bad. Now if I can get the cross-band repeater function...

832. INDOOR 80M ANT(Hi-perf)

Newsgroup: rec.ham-radio
Date: 1990-02-06 17:41:18 UTC
From: gene@uicsl.csl.uiuc.edu
Message-ID: <29400001@uicsl.csl.uiuc.edu>
Source record: 13637

I have recently tested a couple of models (80-40, 15,12 meters) of the SMALL VERTICAL LOOP design and have had results beyond my wildest hopes. This style should be ideal for many hams with limited space facilities.
It is described in the ARRL Antenna Handbook (15th Ed.) pps. 5-11 to 5-13. They attribute much credit to the W5QJR Hart Loop and the Army Loop which has been around for 23 years (See Down-to-earth Army antenna, Electronics, Aug 21 1967, p-111). I cannot understand why more of these have not come into general use. My most impressive results were evident on 80M (because it's harder for many competitors to put up good-performing conventional antennas). Instead of the 0.9" O.D. copper tubing described in the ARRL tables, I used a 40' roll of K-Mart lawn-edging....a 4" band of somewhat corrugated aluminum. (I made a modest attempt to iron-out the corrugations). In a very quick and (temporary?) manner, I installed this in the attic of my garage which has about 7' head clearance, in the form of a vertically-oriented rectangle...7' high and 13' across. The bottom lays flat on the attic wood-floor (and gets walked on)... the upper two corners are supported by 1/8" nylon rope to nails in the rafters ....as high as possible without touching wood. The two ends meet in the center at the top and since these will have perhaps 40Kv at full-power I used 1/8" nylon rope spanned out so that about 2' of isolation from the wood was provided (still keeping as high as possible because every sq. ft. of "enclosed area" is important). With 100 watts, a conventional large dual-section 300pf/section Xmitting capacitor is adequate (the two sections used "in series" so Hi-Q currents do not pass thru bearings etc).....but when going to 1000W out, things get a little wild....I ended up with three rectangles of copper-clad PC-board from my junk supply , laying horizonatal on a wooden pallet that I supported with the previously-mentioned rope. I simply laid small pieces of 3/8" plexiglass as spacers between the sheets. (I had arc-overs jumping as far as 1/2" because of "sharp edges" of copper-clad). The loop can be pre-tuned with a grid-dipper, or you can simple use a general-coverage re-ceiver to hear the "noise-peak" to decide where it is resonant. It is very easy to get a perfect vswr-match by a small amount of experimenting. It is fed at the bottom center (ground-potential) by connecting the feed-coax shield at or near the center of the 40' roll (probably should mark center before installing it) and this center should be directly below the capacitor gap at the top of the rectangle.....the coax-shield connects to at or near this center, and the center of the coax is simply extended with a 3 or 4' wire and experimentally connected to the loop for good match. (Sometimes, a .001 ufd capacitor helped mine drop to "perfect" (transmitting type-cap), altho not absolutely needed. I am feeding mine with 90' of small RG-58/U coax and running up to 1000 watts output.
To get to the bottom line....in a rather extended two-day test, the results, in my "humble?" opinion have been amazing. Considering that the garage has aluminum-siding (all the way up on the ends), a lot of metallic junk stored near-by sopping up energy and knocking the Q down...plus the

composition-shingles shrouding closely overhead, I still have been able to
experience excellent on-the-air results and have certainly raised a lot
of eyebrows from about all points this east of the Rocky Mountains...
some of the comments almost approaching "disbelief".
The previous day or two, I had it tuned to 40M where it is even more
effective and it was absolute gangbusters there....the main difference is
that it is easier for many stations to have competing antennas such as
2-element rotatables on 40M, and others almost as good.
I might suggest that it might be a little questionable to put Hi-power
at the higher frequencies in a close area where junk is nearby...it might
be conceivable to have something absorb enough energy to start a fire??
A few days previously, I had test the VERTICAL LOOP on both 15M and
12M, with an aluminum square frame, 35" per side, made from stock about
1/2" by 1 1/2", one corner left open and two parallel aluminum plates
attached for tuning. It was strapped to a wooden 8' step-ladder in my
driveway (vertically) and a perfect match was easily obtained by simply
putting two small battery clips on the ends of the coax, allowing a
spread of about 6". These were bridged across the corner opposite the
tuning gap (which was at the top)...approximately a 5" spread.
Here I only used 100 watts for testing but I'm sure it would handle
the KW without problems. By now you won't be surprised to hear that it
worked beautifully..usually similar reciprocal results on most stations
I worked...I even had a decent contact with Johannasburg, S. Africa.
The comparitive results of this loop design should be even more
dramatic on 160M if you can contrive a square at least 30' each side!

> but what happens if you go to a third country to operate?

I'd say the answer is very simple: check the rules of the country where you're operating. They get to define what happens. For example, you may get to pick which of the two licenses you use as the basis for your reciprocal operating privileges. Or, given that one is a CEPT license, you'd (presumably) use that one wherever a CEPT license is recognized.

It's certainly possible that a country would expect you to use the license from wherever you're a citizen. On the other hand, the US (for example) doesn't do that. Its only restriction is that you cannot use reciprocal privileges if you're a US citizen.

In other words, don't rely on "rule of thumb" answers, since they are likely to be misleading

> By the way, would contacts made under both callsigns count as
> one person for DXCC purposes?

I don't see why not. For example, if you upgrade and change your call, that's fine. The DXCC rules do require that all contacts must be from "the same DXCC country" -- so contacts from Switzerland and from the US cannot be combined.

834. Re: Digital audio - no more QRM?

Newsgroup: rec.ham-radio
Date: 1990-02-06 20:48:43 UTC
From: koning@koning.dec.com
Message-ID: <8160@shlump.nac.dec.com>
Source record: 13639

Digital audio as the answer to QRM (or to band congestion, etc.) sounds dubious to me. About the best voice encoding you'll find gives a 2400 bps data rate. That requires 8 bits per baud with current FCC rules (for those in the USA) and in any case would be pretty hard to send efficiently through shortwave radio channels. And of course this doesn't give you "hi fi" by any stretch of the imagination, though it would give you "telephone grade" voice.

Apart from that, this won't eliminate QRM, it merely changes the way in which QRM manifests itself. Instead of hearing the voice through noise and sqeaks, you will hear either (a) gaps in the voice, or (b) delays ("stuttering"). (a) applies if you don't retransmit, which is the common approach in "packet voice", (b) applies if you do. I don't know what the success rate of packets on HF is, but I'd be surprised if it is above 25%. That rules out (a) completely, and says that on (b) you need an average of 4 retries per packet. So your necessary bandwidth goes up to 9600 bps. Good luck!

835. Connector adaptors

Newsgroup: rec.ham-radio
Date: 1990-02-06 20:54:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <9002070806.AA13281@ucbvax.Berkeley.EDU>
Source record: 13640

The most flexible connector adaptors I've seen are available from Heath (HCA-3001). It is a modular kit consisting of 24 connectors of 16 different types, plus six center sections. To make an adaptor, you screw one connector end on each side of a center section. This gives some 240 possible combinations. The connectors are well made, and the center pins are all gold plated. The connector types are male and female of: UHF, mini UHF, N, BNC, TNC, SMA, RCA (phono plug), and F. It's proven very handy several times until I got around to finding or making a dedicated adaptor.

> start a flame war, but can anyone tell me what band this is and
> if it is legal for such language to be used over the airwaves?
>
You are listening to what is commonly known as 'freeband'.
This extends from the top of the legal CB band (27.4) to the
bottom of the amateur band which begins at 28.0. Those
frequencies, which are licenced for use in the business and
forrestry radio services, have been appropriated by
unlicenced users as a hobby band. Such use of an unlicenced
radio is blatently illegal, so the question of whether their
language is proper is moot.

These geeks are so disconnected from reality that many of
them will not admit, and perhaps do not even realize, that
their activity is illegal. For example, someone will claim
a freqency and defend it against all comers, which is rather
absurd, given that none of them has right to be there. What
takes place in the freeband is often absolutely disgusting.
I heard one freebander who felt it was his mission to
preserve the band for "English speaking Americans". Since
the skip was in to Mexico and much of Latin America (where
the band is used in a similar illegal fashion), he had a big
job. I couldn't repeat most of his language (I don't even
know some of those words), but the general gist was that
they were scum of the earth, and the USA ought to lanch a
nuclear attack and blow away everything south of Texas.
What a great ambassador.

My radio tends to throw up whenever I tune to that part of
spectrum, so I aviod it like the plague. I do wonder about
it when I hear 'no-code' mentioned, tho.

837. Learn the <*> code!

Newsgroup: rec.ham-radio
Date: 1990-02-06 22:28:33 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9002062324.AA17072@ti.com>
Source record: 13642

Michael O'Dell writes:
>Why is it that some people think that when you "learn the code" it
>stays learned?

I learned the code in 1955. I abandoned the hobby in 1956 before getting past the Novice requirements. In 1989 I gained a new interest in Ham Radio and began taking classes at my local Amateur Radio club. AMAZINGLY, I found that I could remember all the characters! With only a couple of training sessions I was able to pass the 5WPM test again.

>Did you never, ever study for a final, take the test, and promptly
>FORGET how to even spell the subject of the course???

Yes, I've done that; as, of course, have we all. What this demonstrates is the difference between LEARNING and MEMORIZING. When you learn something (swimming, bicycle riding, math rules) you don't forget it from non-use; you just become a little rusty. A quick refresher will get you back up to the level you left off. Why do you think schools have a short period of refresher materials after a summer break?

>I learned it solidly.....

I doubt that you learned it that well if you can't recall the characters well enough to copy a message after an hour or so of copy at 5WPM.

>...that doesn't stop me from working on TCP/IP and spread spectrum
>modulation.

I can do fairly well at 20WPM now, but I can't answer the first question about spread-spectrum. Should I demand that new technology not be used in Amateur Radio because I don't understand it or master it? Of course not! All it takes for me to do so is a little (lots) of time and effort to learn it. If I'm unwilling to do that bit (and I am), you won't hear me complain.

>I bring this up because (lots of hyperbole)...

I have a feeling that REAL reason you brought it up is because you don't want to bring your speed up to 13WPM in order to get more operating spectrum.

Like Bob, WA8YCD, pointed out: No-Code is coming. When it does I just hope it doesn't bring with it an unmanageable, undisciplined group of operators with it, who, unlike ourselves, might view the rest of the operating practices and rules as antiquated and outdated as the code requirements.

[random ramblings]

I often refer to FM as Fuzzy Modulation for a couple of reasons. For one thing, when trying to listen to a wideband broadcast FM signal in AM or narrow FM modes, the signal sounds quite fuzzy. For the other, the actual width of the entire signal depends on the signal strenth AND a threshold in which you consider the strength of sidebands to be significant, as well as the modulating frequency. Because I cannot put an exact value on the width of an FM signal, and because an overlap of sidebands is taken for granted in squeezing FM channels, I think of FM as a fuzzy modulation.

In addition, many FM transmitter are really PM. I'll leave you to your imagination of acronyms for PM.

AM is rather specific. If you limit your modulation upper limit to, say, 4 khz, and your carrier frequency tolerance to + or - 0.5 khz, and have a filter skirt width of 1 khz, you can EASILY have 10 khz channel spacing.

At the narrow bandwidths we try to squeeze FM into on the ham bands and even the public service and land mobile bands, we are not really getting much of a benefit from the quieting effect of FM. There is some, to be sure, but the tighter we squeeze, the less we get.

Noise (and interference) immunity is a function of the redundancy we have. That why CW "get's through"; because it is very redundant. That's why we are trained (told) to repeat out words or use phonetics; that's redundancy. Even increasing power is a form of redundancy. And of course extra sidebands are a form of redundancy.

SSB appears to have no redundancy, but in fact has plenty. By eliminating the other sideband, the redundancy is removed, but this also give you the extra headroom in your transmitter dynamic range to increase the power by 3db. That puts you back to square one, but you can also filter out the noise from the unused sideband on receive giving you a 3db noise advantage. The next step is getting rid of the carrier, which is reproduceable in the receiver, and makes up 2/3's of the transmitter's total output power. That let's you up the remaining sideband power by another 5db.

But why does AM sound better than even SSB?

Obviously, if the inserted carrier in the receiver is off frequency, then the audio is distorted. But even if it is on frequency, the phase might be off, which is still a form of distortion. Further, because phase is considered to be not that critical (for general communication) the phase accuracy of the whole modulation process is considered to not be critical, so SSB modulators can end up causing a lot of distortion, particularly in phase linearity.

Properly modulated AM does not need to play tricks with the signal. You don't need filters to remove the opposite sideband which have the side effect of adding some new distortion. You don't need phase shifters to generate SSB which can cause distortion in phase and amplitude linearity. While new digital techniques can virtually eliminate the distortion, they are still expensive if done totally right.

AM does SOUND better.

Why would one want to use AM? Because it sounds better AND because they don't need the advantages SSB has. Why not use FM? Maybe the disadvantages of FM are undesirable in certain circumstances.

Each of SSB, AM, and FM have their advantages and disadvantages. But what is actually wrong with using AM in certain circumstances where it has its advantages?

While I personally believe using AM on bands that are crowded to the point where SSB signals are overlapping is a bad idea, such is not the case with some bands such as 160m, 10m, 6m, a small portion of 2m, and portions or all of higher bands. So what is wrong with people using AM on these bands, or at least on an appropriate portion of these bands?

Also, has anyone tried working with reduced carrier (in phase) double or single sideband? Do syncronous demodulators retain the original phase of the locked carrier (assuming path distortions are not significant)?

Source record: 13643

In reply to information on getting started....

Ok, here we go....

Ham Radio Magazines:

QST Magazine (journal of the American Radio Relay League - ARRL)
225 Main St
Newington Ct. 06111
Phone: 203-666-1541

Ham Radio Magazine
Greenville, Hew Hampshire 03048-9988

73 Magazine
WGE Publishing Co.
WGE Center
Forest Road
Hancock, New Hampshire 03449
Phone: 603-525-4201

Worldradio
1779 Tribute Rd. Ste. L
Sacramento, Calif. 95815
Phone: 1-800-365-SUBS

I don't know how far Reynoldsburg (Columbus), Ohio is from you
but there is a ham radio store called Universal Amateur Radio INC.
1280 Aida Dr. 43068 there. Their phone is 614-866-4267.

There are several radio clubs in Ohio that could assist you in obtaining
your license. One club is the North Coast Amateur Radio Club.
P.O. Box 30529, Cleveland, OH. 44130
They meet the first Thurs. monthly at the Old North Olmsted Town Hall
at Dover Center and Lorain Roads between the city hall and the police dept.

The above club info came from Worldradio magazine. There are also 6 other
clubs listed in Ohio. e-mail me if you want all of their addresses.

As for how to get started, I highly recommend buying a copy of "Tune In the
World with Ham Radio" from the ARRL (see above for address). It costs about
$20.00 with morse code tapes. Also, most every radio club will assist you
in getting your license. The book tells you just about everything you need
to know to get your ticket.

As for dealing with the FCC, there is a volunteer examining group that gives
the ham tests now, different from what it used to be years ago. It's called
the VEC program. Chances are that there are some VECs in your local club

to give you the test.

Last, if you have ANY questions, don't hesitate to e-mail me. Most of the people on this group would be more than happy to help.

Last, last, don't let the prices of new equipment scare you. You can get on the air with very good used equipment for a couple of hundred bucks or less. And..... don't let the code scare you. I know elementary school kids that can master it.

Have fun!

> on a 24AT without the correct hardware mods. BTW, this has been attempted
> on 2 units with serial numbers around 1000 and mid-1100's, neither of which
> worked. :-(Like I said, the ones with the mods aren't here yet.

This would imply the mods might be Receive Only or else they have changed
the software in the CPU to not require the mods for Receive. The mods done
for receive might be different for transmit. I really would like to find
out if it can be made to transmit on 902 Mhz. Such a radio would be nice,
but even if not, 902 Mhz receive, and 220 Mhz receive, are nice to have.
One can set up a full duplex autopatch with the HT transmitting on 70cm
(not on 2m since remote control of a station cannot be done on 2m and the
full duplex patch would be a station in remote control) and the HT receiving
on 220 Mhz (pending enough available spectrum) or 902 Mhz.

> we do with these reasonably priced consumer radios? If you know,
> please post to the net. My intention is not to start some cosmological
> discussion of "Why I need to be a ham".

It seems like the opportunity here is to convert the marine radio to
2Meters. (People already convert CB's to 10 meters.)

Editorial comment: the marine radios and CB's often scrimpt alot on
the quality of the radio to acheive the lowest possible cost. I'm
not sure that's true of the cellular telephone, though. They appear
to use large amounts of integration (as in integrated circuit) to
acheive there cost advantage.

843. New Car Radiated Emissions

Newsgroup: rec.ham-radio
Date: 1990-02-07 03:19:34 UTC
From: bobw@col.hp.com
Message-ID: <4380068@col.hp.com>
Source record: 13645

Check out the EMI radiating from the next car you buy, before you buy it. Two recent events with new car buyers:

1. My friend bought a new Subaru and installed a 2 meter rig in the car. Unfortunately, he later discovered that a device (thought to be the fuel pump) radiated a strong signal on 146.97 MHz, which happens to be the output frequency of the local repeater. He intends to try to reduce the radiation by capacitively bypassing the offending device, but hasn't done this yet.

2. I bought a new (1989) Jeep Cherokee and installed a 2 meter rig in it. I orginally put a Larson antenna on the edge of the engine hood (using one of those L shaped brackets). I discovered that the engine in general radiated gobs of RF all across the 2 meter band. After much investigation, I decided to move the antenna to the rear of the vehicle. This eliminated all of the interference except for one signal on some obscure simplex freq that I never use.

So what do you do? Take the car on a test drive to a local RFI range? Haul a spectrum analyzer down to the dealer? Ask the dealer for a plot of the radiated emissions?

> Transmit range doesn't appear to be affected unfortunately. I was at

Something I have been contemplating recently concerning this is to petition the FCC for a rule, or maybe even ask my congressperson to start a bill, to require that ALL equipment sold in the amateur market be capable of operating fully (i.e. receive, and if it is a transmitter, to also TRANSMIT) on the ENTIRETY of each amateur band that it is capable of operating on. Exceptions would be made for equipment which does not incorporate the basic tuning mechanism; i.e. transverters, amplifiers, antennas, etc. The justifications for this would include:
1. Reduce the temptation for amateurs to modify equipment in such a way that opens up transmit capabilities where operation would be illegal (and thus preserve the legality of so doing where one find it absolutely necessary to do).
2. Reduce the justification of manufacturers to provide such modification information, or to implement the capability for such mods, that enables the radio to be useable in services that require type-acceptance.
3. Shift the advantage/disadvantage slightly in favor of domestic radio manufacturers over that of foreign ones (we have 30 Mhz of 70cm and "they" only have 10 Mhz).

If it were not for the fact that I am a "keep the government out of everyone's affairs" type of libertarian, I would have already proposed and pushed for this law. Maybe I will anyway. I certainly won't fight it if someone else does.

> Thanks in advance!!
>
> Avi Plotnik, 4X6LP

Avi,
I checked my copy of the World Radio TV Handbook last night. It lists 12
different sets of frequencies for the VHF TV bands, and 5 for the UHF bands.

It would take a while to type them all out ... can I suggest that you try
and get hold of a copy of the WRTVH (expensive to buy - last years cost about
18 pounds sterling - so try to borrow one). This has lots of information
regarding each country's standards, stations, and transmitters.

Most of (Western) Europe uses a standard set of (vision carrier) frequencies
for UHF, using channels designated 21 (471.25 MHz) to 68 (847.25 MHZ)
at 8 MHZ channel spacing.
But note that there are several different systems in use, and hence the sound
frequency (and modulation) can be different according to which country you
are receiving.

For example, my "local" countries at UHF are:

UK system I, Pal colour
Netherlands, Belgium system G, Pal colour
France system L, Secam colour

As mentioned previously, there are numerous VHF frequency allocations, many
using obscure systems.

SYSTEMS
=======

System Lines Channel Vision/Sound Vision Sound
Width Separation Mod Mod

```
------ ----- ------- ------------ ------ -----
A 405 5 - 3.5 (MHz) + am
B 625 7 + 5.5 - fm
C 625 7 + 5.5 + am
D 625 8 + 6.5 - fm
E 819 14 +/- 11.15 + am
F 819 7 + 5.5 + am
G 625 8 + 5.5 - fm
H 625 8 + 5.5 - fm
I 625 8 + 6 - fm
K 625 8 + 6.5 - fm
L 625 8 + 6.5 + am
M 525 6 + 4.5 - fm
N 625 6 + 4.5 - ??
```

Note that some of the above are now obsolete (eg. A was the old UK system on VHF).

Regards,
Bill

>All it takes for me to do so is a little (lots) of time and effort to learn
>it. If I'm unwilling to do that bit (and I am), you won't hear me complain.
>
>Dube, N5PDK

Now there's an interesting proposal. Of course I don't see where anyone
has ever reccommended outlawing CW. Only not requiring it.
Of course based on what you have said above, I could use the same argument
towards you. Why should you be allowed to have a license if you don't
know about spread-spectrum?? What makes one facet of the hobby (CW) any
more important than any other (spread-spectrum, packet, SSTV).
NO matter how much arguing gets done, once all the emotional reasons get
thrown away, there is not one valid technical reason for forcing people
to learn an obsolete form of communications in order to use a radio.

And in case your curious, Yes, I can copy CW. BUt regardless of all the
arguments to the contrary, I have a couple of machines that can do it a lot
better.

I'm active in Europe on 2m/70cm at the moment, but I'm getting
the urge to at least listen in on some HF. Maybe this'll get me excited
enough to get my code speed up and get an HF license. So, what's a good
place to find voice in the HF bands. Particularly DX stuff. I normally
listen from 1800-2300 UTC. I've found some activity on 40m, but there
are a lot of broadcast stations in that band in Europe, so it's a bit
difficult. Other suggestions?

Michael O'Dell describes how he's forgotten all the code he ever knew.

I'd say that's nothing to be especially proud of. Sure, it happens.
But it's a loss and as such it's nothing to crow about.

I probably would have a hard time with 20WPM now but I don't think
I'll ever forget the code considering that it stayed with me for
5 years at a time during radio layoffs.

I forgot to mention that the 2:1 VSWR bandwidth is about 30 khz. The Handbook tables show a "bandwidth" of about 5 khz for a 38' circumference model. Does anyone know if their BW specification would mean a similar 2:1 VSWR width? ...or if not, how would they relate? Based on my experience with mine, it seems that a 5 khz 2:1 VSWR width would be a nuisance to deal with, and the voltage problems would be horrendous?? (80M).

Don't be surprised if you hear nothing from JAS-1B based on the elements I posted last night. As has been our experience with almost all pre-launch estimates, these elements gave predictions that were considerably off less than a day after launch; this morning's pass was more than 10-15 minutes late. I'll post new elements as soon as they are available.

> LCD or LED clock that has 24 hour format.

Practically all electronic digital clocks are 24-hour. The only problem is that an idiot light goes on for AM pr PM instead of the more logical solution of having a 24-hour display.

About a year ago, I (after arriving late for work because I accidentally set my alarm for 6:30 PM instead of AM for what seemed like the 32767th time) took my digital clock apart, clipped one end of an alligator lead to the positive lead of the clock's power supply, clipped a 1K resistor to the other end, and started probing the unused terminals of the digital clock chip. Viola! The third one I tried, the display changed from 5:36 to 17:36. I soldered the 1K resistor in place and put the clock back together.

One minor problem is that while virtually all clock chips support 24-hour displays, many clock displays only have 3 1/2 display digits. Therefore, 22:30 looks like (small superscripted 1) 2:30. I still prefer this to the AM/PM idiocy that I had before (and I haven't accidentally set my alarm for 6:30 PM since).

The 902-928 Mhz band would be a fair target. It is an ISM band also, which is why we get to be there in the first place. In addition, there are some areas of the country, such as Denver CO, where operation on that band is prohibited under amateur rules (though oddly enough is OK under part 15 to 1 watt, so why can't hams be allowed 1 watt in those places?).

Anyone have any details on the AVM systems that also occupy the band (and are causing its own potential threat)?

> This is perhaps a little extreme, especially for narrowband equipment.

Do you want to lose 450 Mhz of it because all the manufacturers are making equipment for just one portion, and all the hams are just using what the manufacturers are making the equipment for?

If the rig is tunable, it must tune the whole band. If it is a rock bound rig, it at least must be capable of being tuned by the normal means of such tuning (change crystal and tweak the stages) across the whole band. Without such flexibility in the hands of hams, we cannot keep the whole band.

These days, the size of our bands will be adapting to our level of usage, not the other way around.

> Consider 70cm. Do you want rigs produced for FM that are capable of
> going into the region of the band that is allocated (by gentleman's
> agreement/band plan) for ATV, or SSB/CW, or packet? It may not sound
> like such a bad thing, but I can tell you 144.2 is far worse for lids
> operating nearby in FM than 432.1 is.

YES!!! First of all, just where these other modes operate varies across the country. I would not complain if my FM only rig didn't operate between 432.0 and 432.2 Mhz, but there are other frequencies I may need to use for some reason or another. As an ATV operator I may want to use this rig as an audio transmitter set 4.5 Mhz offset from my video carrier.

As for packet... I may very well want to use the rig for packet!

This same gentleman's agreement you talk about also puts auxiliary links and repeater control frequencies BELOW 440 Mhz, and in some case down around 430 mhz, in some parts of the country. I want to use my general purpose FM rig for accessing the control frequency of my repeater, or to access my full-duplex autopatch, or any other such function. I don't want to be stuck on the FM repeater and simplex frequencies for this.

> Consider receiving out of band. I believe that the reason why the
> majority of mods are done is to be able to receive outside the amateur
> band. (Maybe my perception is warped since I don't operate much below
> 432 MHz.) A law requiring that an entire amateur band be covered will
> not dampen the desire to modify in order to receive out of band.

It would be possible for the manufacturers to sell the radios with the out of band receive/only mods already in place in the US. They already do this now for 138-174 Mhz, and with the recent discussion about the IC-24AT, I don't think that receive/only needs are going to be any

problem.

> All government is bad. Big government is worse. You can tell when a
> politician is lying by watching for lip movement. [All IMHO.]

Would you rather your ham bands be decided by American politicians or Japanese politicians? As long as THEY have small bands, THEY will be making radios that transmit only on small bands. Soon WE will have only small bands because of it.

> Having heard an ACSSB radio and heard a talk on how it works,
> my guess is that ACSSB gives you the best of both worlds.
> I'm really curious why amateurs aren't busily experimenting
> with ACSSB...

From some things I have read about ACSSB in comments filed with the FCC by certain land mobile parties during the 220 takeover, ACSSB is patented and trademarked as ACSB by one or more companies. For a manufacturer to get in the ACSSB business, apparently they will have to pay a royalty to the owner of the patent. I suspect this is partly why big land mobile companies like Motorola, GE, and Johnson, did not show any support for taking away 220 Mhz just for narrow band services. They may be doing a "wait and see" or perhaps working on their own narrowband system.

Another reason hams are not experimenting in other kinds of things is the fact that most of us are so dependent on the manufacturers to lead the way for us (which they won't). Icom, Kenwood, and Yaesu would have to (apparently) pay a royalty on ACSSB, so that is out (why would WE pay MORE for a mode that is somewhat lower quality than FM, when FM works just fine). They also have no interest in developing new modes of their own. Actually, they might be in the same situation is Motorola and that bunch, since at least one of them I know sells commercial land mobile gear in the US, and it's all FM (except for aircraft stuff of course).

Hey, if YOU can put together a construction article on converting an common amateur FM HT of the miniature variety over to ACSSB, then I am all ears. It has to be a reasonably short working time (2 weeks or less) and easy to do without an electronics development lab.

I have a TS-180, its power input to the final PA is given as
160 to 15 meters 200W PEP
10 meters 160W PEP
and I've noticed many rigs from the early 1980's are derated
on 10 meters (the solid state ones, I mean). My guess is that
the RF power transistors of the day were inefficient at 28MHz
and the power was reduced to keep the heat down and prolong
thier life, or else the ferrite materials used in the broadband
transformers was not as good as the newer stuff and would
saturate/heat at high power+high frequency.

So, all you RF design guru's out there, what do you think?

I favor a no-code license on VHF for digital communications, but in all fairness I must point out that all these bandwidth efficiency equations leave out the cost factor. CW is popular because it not only works but it's CHEAP!! In the recreational context it's FUN. Those reasons aren't enough to FORCE everyone to learn it, but let's not deny "the devil" his due.

Since the code/no-code war already seems to have flared up again here, I guess it won't make things much worse to relate an interesting rumor I heard the other night from a pretty reliable source.

The ARRL's no-code proposal apparently comes up in front of the Commission later today (Thursday 2/8). Interestingly enough, the Commission reportedly plans on proposing full VHF/UHF privileges for the no-coders, i.e., everything above 30 MHz.

And even more interesting is that the Commission will reportedly issue an ultimatum to American amateurs: either accept its proposal for full VHF/UHF no-code privileges, or the FCC will consider amateur radio to be dead -- they will refuse to support us at the upcoming WARC, and they will remove the last remaining internal barriers to the domestic reallocation of amateur spectrum to other services.

If this rumor turns out to be true, the FCC will have laid down the gauntlet for the amateur community in the US -- and more power to them for having done so. I only hope the League and the general rank-and-file will wise up to the inevitable and not be so stupid as to pursue a scorched-earth policy.

Flame me if you want, but I can't help but see some eerie parallels between the attitudes of the general US amateur population and those of the Communist Party elite in certain Eastern European countries a few months ago...

^^
> for what you REALLY want -- a law that says everyone has to do
> everything you want and cannot do anything you don't want?

That is sure a fine example of creative misinterpretation. Such postings DESERVE flames, but I'll try my best to keep from igniting.

The purpose of being able to cover the whole band is NOT to trash the weak signal bands. Are you one of those people who is trying to protect the weak signal bands by encouraging that radios NOT cover most of the REST of the band? Are you willing to lose 420-430 Mhz in the rest of the USA just to protect 432.0-432.2 Mhz?

Yes, I do rant, and aside from your misinterpretation of my posting, my rantings are at least consistent. If I erred in my posting, all that you are making apparent so far is my inability to make myself clear to you.

Now...

Presently, my proposal would affect very few weak signal bands. In fact it will probably only affect ONE. FM rigs now cover the whole band, and thus cover the weak signal bands, at 144 Mhz, 220 Mhz and 1296 Mhz. Is there really that much abuse there? I really don't know if there is or not; I will take your word for it if you say there is. Shall we make a rule that FM rigs NOT be permitted to transmit there? I gather that you really don't want to. But the EFFECT of your disapproval of my suggestion is to say it's OK to leave out the transmit on the AUXILIARY, PACKET, and ATV AUDIO frequencies so that ONE bands's weak signal segment can be saved from a few lids doing simplex kerchunking on 432.1 Mhz.

What I want to do is make use of the WHOLE 70cm band from 420-450 Mhz without having to modify my rig to allow TRANSMIT on public service bands. I don't intend to operate on the weak signal bands with FM. I do intend to operate on the AUXILIARY bands and PACKET bands which have many frequencies below 440 Mhz. In addition, an FM rigs is useful as an audio transmitter for an ATV signal on 425.75 and other such frequencies.

My complaint is that the Japanese are not considering that there even exists a band here in this country below 440 Mhz or 430 Mhz depending on what radio you happen to buy. In the past they ignored the 220 Mhz band, and because of that and the fact that we hams prefer to just buy radios, we are LOSING much of that band, if not eventually all of it. I don't want this to happen to the 420-430 Mhz portion of 70cm for the part of the country that still has it, nor even any other part of 70cm which might be possible.

If I am trying to force anything down anyone's throat, it is that the manufacturers are not to be in any position to decide what parts of our bands get used and what parts do not, and especially not to decide that we only get to use a portion no larger than hams get in the home country of the manufacturer. Somehow we need to extend this to say what bands, but I haven't figured out a way.

I might just point out at this point that the ARRL bandplan for the FM repeater portion of 23cm calls for 25 khz channeling just like that used on 70cm and just like in Europe. The Japanese manufacturers (at least 2 of them anyway) have decided to market rigs with 25 khz channeling in Europe, and rigs with 20 khz channeling in the USA. Is this a case of THEM trying to tell US how to use OUR band or what? The fact that they market 25 khz channeling in Europe proves that they CAN make such rigs, so they either are trying to make us use 20 khz channels like they do in Japan, or else are just plain ignorant or misinformed about what is going on here.

Now, if you don't understand me, please ask more questions and I will try to make myself even clearer. If it takes lots of bandwidth for this, then I will use e-mail. If you think my proposal will have certain bad effects, then please explain them without assuming that my intent is to have those effects. Show your line of reasoning as well, or criticize mine, but don't just make assumptions about my intent.

I agree. Yes, I support a no code license, but that does not mean I hate code, dislike code, or think anything is wrong with it. CW, like any other mode, has its place in Ham Radio. Indeed, it has a very important place.

There is no "devil" in code. Someone who is less (or not at all) interested in the technical, experimental, or construction side of Ham Radio can do things like build up an expertise in operating code. As Jim points out, it can be a fun experience. Oh, maybe not for everyone, and as for myself, I have not yet given it a try, but certainly the potential exists for quite many people. Code can also be used for experimenting, too. It's a simple way to test simple transmitters and receivers, if not entirely intending them that way. I even know of one who has told me how he used Morse Code as a means to test modems!

But in the same breath I believe those who prefer to not even try code should not be denied into ham radio. This hobby is now too large for but maybe a few hardy souls to try everything. Let's just let people choose what they want to try, and let them contribute to the service the best they can in the ways they prefer to.

My 1987 model has some weak harmonics almost every 1 Mhz, with #147 around 147.025 Mhz. It's not troublesome, but I do agree that you should check out what the RFI/EMI is in your new car. You should also check these things out in your new house as well, BEFORE signing the offer to buy, or else add a clause to the offer that any RFI/EMI affecting the amateur bands not be present, or be removed by the time you take ownership, without risking the money in your offer. See your lawyer to word the clause.

869. J-Poles and Other End Fed Half Wave Antennas

Newsgroup: rec.ham-radio
Date: 1990-02-08 13:37:40 UTC
From: jdobbs@MWUNIX.MITRE.ORG
Message-ID: <9002081337.AA02373@mwunix.mitre.org>
Source record: 13674

I've been following with great interest the discussion of J-pole antennas. This seems to be similar to an end fed Zepp which is a half wave radiator fed by a quarter wave transmission line to transform the high impedance antenna feed point to coax impedances. The quarter wave matching stub on the J-pole seems to be doing the same job. I currently use a Zepp feed for a 2m vertical and a 40m sloper. What is the difference between the J-pole and the Zepp or are they really two versions of the same thing? Why not just end feed a 3/4 wave length wire with coax, especially in a horizontal or sloping configuration?

Source record: 13675

Gene wonders why his small 80 meter loop antenna has around 30 kHz bandwidth when the ARRL Handbook says it should be 5 kHz. Assuming the ARRL calculations are correct, the answer is probably losses in the antenna. If you used a lossier conductor material then they specified, you would get extra resistive losses.

The radiation resistance of a small loop is proportional to the square of the loop area, or the FOURTH POWER of the length. Small loops have very low radiation resistances so that even a small amount of loss resistance can waste most of the power.

Going from 5 to 30 kHz bandwidth implies that the loss resistance is 6 times higher than radiation resistance -- in other words, only 1/6 of the power is being transmitted, a 7.8 dB loss -- about 1 S-unit. You likely would not notice this in on-the-air operation unless you were doing a side-by-side comparison with a full-sized antenna.

In article <30500379@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
]as the modulating frequency. Because I cannot put an exact value on the
]width of an FM signal, and because an overlap of sidebands is taken for
]granted in squeezing FM channels, I think of FM as a fuzzy modulation.
]
]AM is rather specific. If you limit your modulation upper limit to, say,
]4 khz, and your carrier frequency tolerance to + or - 0.5 khz, and have
]a filter skirt width of 1 khz, you can EASILY have 10 khz channel spacing.

Phil, you can no longer put an exact bandwidth on AM than you can on
FM. In FM, the bandwidth depends on the modulating frequency and the
deviation. In AM, it depends on how good your filters are and how
linear your system is. Thus, one can easily argue that any AM signal
has an infinite bandwidth (filters not perfect, some non-linearity
beyond the audio filtering) as easily as one can argue that for FM.

]Also, has anyone tried working with reduced carrier (in phase) double or
]single sideband? Do syncronous demodulators retain the original phase of
]the locked carrier (assuming path distortions are not significant)?

Your arguments (mostly deleted above) apply best to this last
conjecture. If you wand hi-fi and narrow band, you want SSB with enough
carrier present to phase-lock the demodulator. Hams have experimented
with a variant of this that also compandors the signal, achieving
a more constant transmit power level - ACSSB.

Joe--most days, 10 meters is wide open between Eu and North America between 1600 and 2000Z, especially if the solar flux is in the high 100s (like >180 or so). 15 meters is similarly good, about the same times, perhaps earlier to later on good days.

Or, check out 20 meters about your local sunrise, 0400-0600Z. Signals to the West Coast of the US most nights (here) are simply awesome these days.

Now is THE time to upgrade--we may not see DX conditions this good again in our lifetimes (no joke). And even tho the sunspot peak will be this year, we have 2 or 3 excellent years left in this cycle.

Good luck--Jim, K6ZH

I noticed a very similar problem with my inlaws 1988 Chevrolet truck. I have been carrying a synthesized Motorola radio for several months. When we borrowed their truck to move, I noticed so much RFI that I actually couldn't use the radio unless the channel was PL'ed. It was most apparent in the 154-155 MHz range. I was glad to return the truck and get back to our own vehicles.

I remember this coming up several months ago on this net. Didn't someone say that GM (maybe it was Ford) has a team of people that check for these problems before cars go into production? If they don't, maybe they should.

Source record: 13580
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Well it comes to this: I want to monitor all those buzzes, beeps and chirps I hear on my Icom R71 and I now I need more equipment. I know there are really two routes:

1) Stand alone decoders that can connect to a printer monitor or other RS-232 device

2) Decoders that utilize your IBM computer for the brains.

I happens to have a Radio Shack 1000 I don't use much I could utilize in this endever.

Here is the question: I see the Universal 'M' series of decoders starting at about $500.00, I se several small RTTY, ASCII, and CW decoeders with little 25 or so element "Times square marqee" displays and then MJF has a RTTY, CW, and ASCII decoder that connects to an IBM PC for about $75.00

What is the best way for a beginer to get into the monitoring of the digital utility stations? How much can I expect to spend? Should I go stand alone, "Marquee Display" type, or units that require an external computer?

A while ago I posted an address for obtaining "foreign" airmail envelopes. Someone later sent me mail asking for a repeat - sorry to whomever it was, I then lost your mail. However, I came across a new address today so here are both of them:

DX QSL Associates: Brian Treadwell, 434 Blair Road NW, Vienna VA 22180

DX Supplies: William J. Plum, 12 Glenn Road, Flemington, NJ 08822

Both of these guys, and others whose addresses I don't have handy, sell various supplies to make foreign QSLing easier (stamps, envelopes...).

Some posters mentioned that it was not as easy as someone else had suggested, simply walking into a large stationery store and asking for European airmail envelopes. I agree. What's more, my parents in England were unable to find any there either :-)

I am finding quite a few of my US airmail return envelopes cut down to a smaller size by people who kindly reply to my QSL cards, as someone else mentioned. If some DX stations go to this trouble, there are probably some others who might send a card but for this inconvenience. I guess you could cut down your own U.S. envelopes when you send them...

The lesson is there for us all to read in the ARRL Operating Manual. It's sort of funny, but in W9KNI's chapter on "how to DX, how to get QSLs, etc." there is the standard advice about sending a SAE, IRCs, all that stuff. There is a photograph of what was sent by K1WJ to a DX station (card, couple of IRCs, and a US-sized return envelope), and another photograph showing the card that was "received promptly". What it doesn't say, but what is clear from the photos, is that the DX manager did not use the SAE, instead he typed the guy's address on a new, smaller envelope. So what was intended to show how good a guy our W DXer is actually shows that he was lucky to get a card, as he sent the wrong sort of envelope (this is on page 5-18 of the 1987 ARRL Operating Manual). The caption even says "note the self-addressed envelope"!

From: karn@jupiter.bellcore.com
Message-ID: <19864@bellcore.bellcore.com>
Source record: 13582

As I had expected, the FCC apparently did formally propose a no-code license at its meeting today. Buried in an AP wire story about "wireless cable TV" was the following:

In other actions Thursday, the commission voted 4-0 to:
_Propose creation of an entry-level, ``communicator class'' of amateur radio license that would not require ham operators to know Morse code. The commission said it wanted to open amateur radio to young, technically oriented people who don't want to learn Morse code.

There were no other details.

I note parenthetically that several other actions taken by the Commission today involved proposing additional spectrum for several other services, including the "wireless cable TV" system just mentioned, plus additional channels for the mobile satellite service. The article did not elaborate, but the writing on the wall should be clear...

In addition to reconfiguring the diodes in the logic strip, you
must peal back the foil on the VCO and spread one loop of the coil to
get it to ocsillate in the 450's +, but you loose the ham band. It's not
like the others with their 30 Meg spreads. You'll have to choose which band
you want without opening the rig all of the time.

I am sure this point has been brought up before, but let me emphasize it. There are times when knowing the code can be very useful and even save lives. There are numerous examples where people, unable to communicate by normal means, have used morse code to communicate. Consider the miner, caught in a cave-in, or the San Francisco resident, trapped under the ruins of his Marina home. Knowing morse code, they could tap on the pipes with a rock to get help!

While a no code license is appealing in some ways, I personally feel it would be a great loss for people knowing the code and those who don't. Let me explain. Imagine for instance a no-code license was established, and I for one reason or another didn't have the time or energy to learn morse code on my own. If somebody was trapped and was trying to communicate to me in morse code, I would feel terrible! Now, consider a person who knows the code, like the person trapped who I was trying to help. He would feel TERRIBLE, too!

Maybe I stated my opinion poorly, but all I am trying to say is: there are times when knowing the code is extremely helpful, and it would be a shame to abolish it from licensing requirements.

All transistors exhibit declining gain with increasing frequency. The general rule of thumb is to select a transistor with an "f-sub-T" (the frequency at which the gain of the transistor is 1) of 10 times the maximum operating frequency, so that the gain will be high enough that the circuit around the transistor determines the stage gain. However, since (big) power transistors are hardest to design for very high frequency work, a manufacturer could generally save quite a bit of money by using a transistor with an fT of, say, 250MHz instead of 300MHz, and just sacrificing a little power gain on 10 meters.

Source record: 13588

The main limitation at 30 MHz for RF power amplifiers
is that the gain drops way down. They are probably
running out of power from the driver stage. The
ferrite has maximum heating at 1.8 MHz. not 30 MHz.
and is not a factor at 30 MHz. What *is* a factor
at 30 MHz. is the transformer leakage inductance which
is tuned out with shunt capacitors and peaked at 30 MHz.
The peaking doesn't completely fix the transformer
parasitics at the high end.

884. Questions on antenna selection

Newsgroup: rec.ham-radio
Date: 1990-02-09 04:38:42 UTC
From: jenglish@tardis.Tymnet.COM
Message-ID: <928@tardis.Tymnet.COM>
Source record: 13589

Hello again;
I am sending this query out for my neighbor WP4ADA/W5. If you remember,
we had to go up against the Town Board to get permission for him to
erect a tower in his yard. Well, they didn't allow the 75 foot tower
he wanted, but they did let him go to 57 feet, the maximum allowable
without any special permission. He is now looking for an antenna to
put up, and would like to know your opinions on some stuff.

His message follows:

I am interested in ham radio comments. Main objective 10, 15, 20 plus
new bands 12, 17, and 30. Do you know of other manufacturers that
offer multibands with all these bands? Presently looking at the
Mosley Pro 57, Pro 67 with 30 meter or Pro 67 with 40 meters. My
greatest concern is the length of some elements for the Pro 67s.
Question #1: If you know, do they look horizontal or do they tend
to hang down due to their weight or length?
Question #2: Between a Pro 67 with 40 meters and a Pro 67 with
30 meters. Which band may be a best choice. I am not
familiar with 30, 40 never called much attention to me,
but I like DX, talking with Japan, Australia, etc. Is
30 the best way to go or is there not much DX and/or
activity out there?
Question #3: What about satisfaction from present owners or users?
Are they happy? Do they feel that they should have
selected the 30 meters rather than 40 meters, the Pro 57
or the Pro 67?

I understand that comments are personal opinions, but different ideas
could help make the best decision.

One last Question: What about a wireless antenna selector switch on a
tower. Are they good? Some people told me that they
are problematic and that I may end up with one coax
for eact antenna.

Thank you very much for your comments and ideas,
Bart WP4ADA/W5

---End of message---

I too would like to thank you all for the help you have given in the past.
You can E-mail me here, or post a reply, I'll be sure and collect
everything and pass it on to Bart.

Jim

Specifications of JAS-1b

LAUNCH AND ORBIT:
1. Launch (scheduled)
Time: February 1990, day is not fixed
Launch Vehicle: H-I (2-stage) rocket
Launch Site: Tanegashima Space Center, National Space Development Agency of Japan (NASDA)

2. Orbit (planned)
slightly elliptical polar orbit, with 900 km perigee
Period: 105 minutes
Inclination: 99 degrees

SATELLITE SPECIFICATIONS
1. Dimension
Size: 26-face polyhedron measuring 440mm across and 470mm in height
Weight: Approx 50 kg.

2. System Configuration
Analog and digital transponder in Mode J
(uplink 144 MHz, downlink: 430 MHz)

3. Attitude Control
Satellite attitude will be maintained by using the torque generated by interaction of two permanent magnets with the earth's magnetic field.

4. Thermal Control
Passive control using thermal insulation

5. Planned service life: 5 years

SYSTEM SPECIFICATIONS
1. Beacon anfd telemetry
JA beacon: 435.795 MHz nominal frequency

ca. 100 mW power, CW or PSK [also capable of A0
transmission]
JD telemetry: 435.91 MHz nominal frequency
ca. 1 W power, packet in PSK

2. Telemetry
CW telemetry: 12 analog data items
33 status items
PSK telemetry: 29 analog data items
33 status items

3. Commands: Equipped with real-time program command function

4. Transponder
Frequewecy and modes (see teh table below) are similar to those of FO-
12. The analog system (JA) consists of the inverted heterodyne transponde,
with a bandwidth of 100 kHz operating with a mode J of uplink 145 MHz and
downlink of 435 MHz.

The digital system (JD) functions as a mailbox using the AX.25 link level
protocol. Stations currently using FO-12 will be able to use JAS-1b without
any modifications to equipment.

(1) Analog System Transponder:
inversely heterodyned linear translator.
Uplink passband: 145.9 to 146.00 MHz
Downlink Passband: 435.9 to 435.8 MHz
Transmitter Output: Approx. 1 watt
Bandwidth: 100 kHz (3 db bandwidth)
Uplink EIRP required: About 100 W

(2) Digital System Transponder:
Store-and-forward packet communication using AX.25
link level protocol, version 2
Uplink Frequencies: 145.85 MHz, 145.87 MHz, 145.89 MHz, 145.91 MHz,
Bi-phased Manchester code on FM signal, with a bit rate of 1200 bps.
Uplink EIRP required: About 100 W
Downlink: 435.91 MHz/NRZI/PSK, 1200 bps
Transmitter output: About 1 W

5. Antennas
144 MHz receiving antenna (R-ANT):
Ring turnstile antenna mounted at bottom of side panels

435 MHz transmitting antenna (T-ANT):
turnstile antenna mounted at the top of satellite (shared by analog and
digital modes)

polarization gain
R-ANT: circular +0.5 dBi max.
T-ANT: circular +4 dBi max.

6. Power Supply
Solar cells (planned)
Cell: Gallium arsenide
Size and Quantity: 2x2 sq-cm and 1x2 sq-cm, over 1300 cells
Power Output: More than 10 W (BOL)

Battery:
Cell type and quantity: 11 series-connected NiCad cells (rectangular)
Capacity: 6 aH

Voltage Converter
Bus voltage: +11 to 18 V (14 V average)
Regulated voltages: +10 V, +5 V, -5 V
Efficiency: Better than 70%

Power control functions:
Bus voltage limit control (full-shurt),and UVC function to disconnect load when battery terminal voltage drops

[there was a block diagram and about 1-1/2 pages of narrative I did not transcribe].

Subj: New FUJI elements

A Japanese ham came on and gave elements for FUJI-20. They are MUCH better than pre-launch elements.

Satellite: JAS-1B
Catalog number: ?????
Epoch time: 07FEB90 023340
Inclination: 99.1161 deg
RA of node: 109.051 deg
Eccentricity: 0.054182532
Arg of perigee: 344.1375 deg
Mean anomaly: 5.3979 deg
Mean motion: 12.842134 rev/day
Decay rate: 0.054182532 rev/day^2 (SIC This number is full of it, use 1e-6)
Epoch rev: 0
Semimajor axis: 7700.056 km

The transponder is quite sensitive. I simply could not turn down my power enough not to be embarassingly loud. There is still some deep fades however from tumbling and the old intermod problem is back (the CW beacon is almost as loud in the lower half of the transponder as it is at the published frequency of 435.795.) This bird is going to be trivial to work.

Subj: FO-20 Corrected Keps

Based on radio observations during Orbits 1 and 13, I believe it likely that the object identified in the Japanese keps posted by N4HY is not FO-20 but probably one of the other products of the launch. Rev. 1, which had an observed TCA here of 02:47:54, was 16 seconds early with respect to the predicted time. That pass was at a very high elevation and the observed time was accurate to approximately 2 seconds or less. Since the observation took place very close to the epoch time of the element set (only about 14 minutes later), I believe the observed difference resulted from FO-20 being separated from the launch vehicle earlier than the identified object. Hence, I have moved the epoch earlier by 16 seconds.

TCA during Orbit 13 took place at 01:16:59, about 69 seconds late with respect to the element set as thus modified. Since Orbit 1 gave us a very good fix on the epoch, I have adjusted the mean motion slightly to fit the TCA observation.

The following element set fits both Orbits 1 and 13 to within one second. I believe that should hold us until we get radar-derived elements. Would anyone able to obtain a good set of radar-derived elements FOR ALL OBJECTS ASSOCIATED WITH 1990 031 please post them so that we may identify the proper object through correlation with radio observations.

Satellite: FO-20

I would like to see hams use the ACSSB in its R3E form, instead of the J3E form companies like Aerotron are trying to put on stolen spectrum. While ACSSB/R3E will require better stability (250 hz) than ACSSB/J3E (maybe as much as 1 khz, more likely 500 hz) to be able to lock onto the signal, I personally think the R3E form would have better quality and less heterodyne.

The difference between these systems is that in the R3E mode, the carrier is present at some reduced level (6 to 20 db down, standardly defined) and serves as the pilot reference for decompandoring, as well as frequency and phase reference. The J3E mode uses a totally absent carrier, with a pilot tone somewhere between 3 khz and 4.5 khz (standardly defined) that serves as the frequency lock, and as the decompandoring reference level (also some 6 to 20 or so db down). The J3E mode cannot restore the original phase of the carrier whereas the R3E should be able to. The J3E mode can deal with poorer stability better because of the greater locking range for the pilot due to its greater distance from the actual audio component.

Either system should perform quite well in reducing co-channel interference through compandoring.

The R3E and J3E nomenclature for these flavors of ACSSB were strictly my choice due to lack of any others.

MICROSAT CHECKOUT PLAN DETAILED

HR AMSAT NEWS SERVICE BULLETIN 037.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1990
TO ALL RADIO AMATEURS BT

Microsat engineer Harold Price, NK6K, reported last week to the 75 meter U. S. West Coast AMSAT net on current priorities for check-out, delivery, and release of the four microsats, AO-16, DO-17, WO-18, and LO-19.

Since the auto-iris in the WEBERSAT-1 camera is the only moving part on any of the microsats, WO-18 is being prepared for payload operation first. The iris is not expected to fail anytime soon, but its lifetime is limited and the team desires to get WEBERSAT- 1 into the picture taking business as soon as possible. Following the upload of improved battery management routines (which have also been placed on PACSAT-1 and LUSAT-1), the first camera control and picture taking software upload is expected early in the week of February 5. A release of the ground processing software for these pictures, known internally as "WEBERWARE 1.0" is expected soon. Picture data will be assembled from files captured during WEBERSAT-1 passes, so, even in the temporary absence of display software, ground users may capture data files from satellite transmissions for later processing.

It has been announced that WEBERWARE may have real color display, i.e., the oceans in the processed pictures will be blue and the dirt brown. Volunteer programers at Weber State University have had good results using a VGA monitor for the display.

SB ALL @ AMSAT $ANS-037.02
SATELLITE STATUS PART-1

HR AMSAT NEWS SERVICE BULLETIN 037.02 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1990
TO ALL RADIO AMATEURS BT

PACSAT-1 experienced a software crash on 31 JAN 90 and was subsequently reset. Indications are that AO-16 is in perfect physical health. Check-out software has been reloaded and all appears to be functioning normally. Software problems and occasional resets for a variety of possible reasons are to be

expected during the early qualification and operational period of the microsats.

Since PACSAT-1 and LUSAT-1 are observed to be in good condition, only the improved battery and power management software has been uploaded to them. Serious effort on the packet bulletin board software will follow shortly as allowed by mission operational priorities.

DOVE-1 is in the best condition of all. The two meter transmitter on DO-17 is, because of its lower frequency, more efficient than the 437 MHz transmitters on the other microsats. This means that battery management is simplest on DOVE-1. Since it is observed to be in such good condition, advanced software and digitalker files will be uploaded to it last after the other microsats have completed thorough memory tests and are well understood. Expect payload operations from DOVE-1 in mid to late February. For technical reasons, the DO-17 S-band BPSK transmitter will be used for intermediate software loading. Those with S-band receive capability are invited to listen in.

DOVE-1 and WEBERSAT-1 are intended to be, in general, transmit-only satellites. Neither has a receiver on its transmit frequency. AMSAT therefore asks that users refrain from attempting to transmit to or connect with these satellites on frequency. Such attempts only cause QRM to other listeners.

SB ALL @ AMSAT $ANS-037.03
SATELLITE STATUS PART-2

HR AMSAT NEWS SERVICE BULLETIN 037.03 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1990
TO ALL RADIO AMATEURS BT

Week two at AMSAT Satellite Factory has been just as busy for the Engineering team as the first week. Because the Microsats had a very short design cycle, priority had to be placed on getting the hardware and bootstrap software operational. The higher level software is being refined and these next few weeks should provide the software team the time required to upload and test the new software.

UO-14 continues to be performing well as the AMSAT-UK team at the University of Surrey progresses with its spacecraft check-out. UO-15 is remaining stubbornly silent and the Engineering team at Surrey is evaluating the situation. Any reports of signals from the UO-15 spacecraft should be forwarded immediatly to AMSAT-UK at the University of England.

The launch of the six amateur satellites has created a ground swell of interest. In a single day, AMSAT sold in excess of 80 tracking programs. Scores of "Press Kits" have been sent to the media. Reports from AMSAT net controls have indicated a marked increase in net participation, by previous AMSAT members who's interest has been "reborn" by the launch and newcomers to the Amateur Satellite game.

NEW TRANSPONDER SCHEDULE FOR AO-13

HR AMSAT NEWS SERVICE BULLETIN 037.04 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1990
TO ALL RADIO AMATEURS BT

AMSAT OSCAR-13 Transponder Schedule (valid until May 09)

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200 BLON = 207.1 degrees
Mode-BS : MA 200 to MA 205 BLAT = + 2.9 degress
Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

From 21 Feb 90 to 21 Mar 90 there will be an OFF period from MA 20 to MA 90 due to solar eclipses affecting AO-13. The length of the eclipses varies from 12 to 89 minutes. During the Mode-S period from MA 195 to MA 200, only the Mode-B beacon will be operational. Optimum squint angle occurs around MA 200.

BALLOON LAUNCH RECHEDULED

HR AMSAT NEWS SERVICE BULLETIN 037.05 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 6, 1990
TO ALL RADIO AMATEURS BT

A weather balloon carrying Amateur Radio equipment is scheduled for deployment on Saturday 10 FEB 90 at 9:00 CST. It was originally scheduled for the previous weekend, but bad weather postponed the flight for one week. The launch will be from Lawrence, Kansas. When the balloon reaches 85,000 feet, its theoretical maximum height, it should have a 450 mile radio range centered around the Kansas City area.

This balloon will have two amateur radio experiments on board: an ATV beacon transmitting on 439.25 MHz (Horizontal polarization) and a Voice ID beacon on 144.34 MHz FM (Vertical polarization). An HF net will be activated on 7.155 MHz to solicit reports. Send QSL reports to: Mike Bogard KD0FW - 2128 S. Norton Ave.,Independence, MO 64052.

LAUNCH OF JAS-1B IMMINENT

HR AMSAT NEWS SERVICE BULLETIN 037.07 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 6, 1990
TO ALL RADIO AMATEURS BT

JARL Reports The Launch Of JAS-1B Set For Febuary 7, 1990

AMSAT-NA President and General Manager, Doug Loughmiller (KO5I) has been informed by JARL President Shozo Hara (JA1AN) that the launch of the JAS-1B amateur radio satellite is now set for Febuary 7, 1990 with the launch window opening at 01:25 UTC and closing at 02:00 UTC. After JAS-1B is successfully placed into orbit, it will be commissioned FUJI-OSCAR-20.

Like its predessor, FO-12, JAS-1B will be a space-borne digital store-and-forward packet BBS using mode JD, and it will also carry a Mode JA linear transponder for SSB communication. The mailbox feature will require a PSK modem and a TNC-2 using AX.25 link level protocol at 1200 baud. There will be two downlink telemetry beacons on JAS-1B. The first one will be for Mode JA at 435.795 MHz and it will send CW or PSK with an output power of 100 mW. The second telemetry beacon will be a Mode JD beacon and will have a downlink frequency of 435.910 MHz. The Mode JD beacon will send PSK packets and will have an output power of 1 Watt. The planned trajectory will place JAS-1B into a high inclination circular orbit. The altitude will be about

1200 km with an inclination of 99 degrees. This will give JAS-1B an orbital period of 103 minutes.

For additional details about this launch, please stay tunned to AMSAT HF/VHF Nets and ARRL Bulletins. As soon as an orbital element set is available for FO-20, it will be posted to the AMSAT/DRIG BBS at (214) 394-7438. For those who would like further technical details about JAS-1B, see the QEX article in the September '89 issue.

SB ALL @ AMSAT $ANS-037.08
UO-15 NEEDS YOUR HELP!

HR AMSAT NEWS SERVICE BULLETIN 037.08 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 6, 1990
TO ALL RADIO AMATEURS BT

University of Surrey Requests Satellite User's Help For UO-15

Following the last reported reception of signals from UO-15 at around 05:00 UTC on 23-JAN-90, nothing has been heard from the satellite -- despite continued attempts by University of Surrey (UoS) Engineering Team to activate redundant on-board systems. While UoS will continues to explore redundant paths and configurations available on the satellite, the time has come to investigate whether the spacecraft has suffered a major malfunction.

It should be possible to resolve this question by listening for residual signals from the on-board local oscillators (to confirm the operation of the power systems) and any very low-level signals at the nominal downlink frequency (indicating a transmitter or antenna problem). If signals from either the local oscillators or the transmitter can be detected, then there are several tests that can be done to trace the nature and extent of the problem.

UoS would be most appreciative of any assistance in the above listening tests. The level of local oscillator signals present at the spacecraft antenna were measured before launch to be -60 dBm. Examination of the link budget associated with the above experiments shows that large antennas and sensitive, narrow-band receivers operating in the 132-136 MHz (local oscillators) and 435.120 MHz (downlink transmitter) will be required to stand any chance of success. It is recommended that tests first confirm the detection of local oscillator signals from the operational UO-14 before attempting to listen for UO-15.

It is also very important that we narrow the window between the last reported reception of UO-15 at 05:00 UTC on 23-JAN-90 and first AOS (or lack therof) at UoS at 10:00 UTC the same morning. Was anyone else listening? Telemetry would be ideal, but even a report of the presence of a signal from UO-15 on 435.120 MHz would help enormously.

If anyone can help (or suggest contacts who may be able to help) - please contact Martin Sweeting G3YJO at UoSAT. Let us all hope that we can yet find our way back!

73 Martin Sweeting G3YJO

42:D2
25CA48BD

WEBER-1>TLM:00:76 01:77 02:5E 03:84 04:74 05:93 06:72 07:85 08:6C 09:34 0A:A3
0B:A5 0C:CC 0D:B9 0E:08 0F:70 10:AD 11:8D 12:06 13:68 14:A5 15:9F
16:89 17:86 18:83 19:8A 1A:83 1B:88 1C:84 1D:8E 1E:26 1F:5F 20:99
25CA48BD

The two telemetry frames are reversed (to make the s/c software easier to write, it has no other significance). More importantly, the 8 digit hex number on the end is the time when the telemetry scan was made. The time value is that returned by the C time() function on an IBM-PC, i.e., seconds since Jan 1, 1970. It serves to timestamp each block of data, and ties two blocks together.

It is separated from the rest of the data in the block by a 0x0d.

A word on how the telemetry is gathered.

At the start of an interval, the "uptime" message is generated, then the telemetry routine is called. The new timestamp number is then

grabbed. Next, all the telemetry values are gathered, in order. This process involves sending 2 bytes at 4800 baud on the internal serial buss, plus waiting 9ms for each value. In addition, each of the 12 current samples takes an additional 100ms. As you can see, with this initial telemetry routine, two values at opposite ends of the array can be separated in time by almost 2 seconds. Both output frames that were generated by one scan are stamped with the same time, however.

The other spacecraft will be changed as they are uploaded with the latest battery management routines.

From: HPRICE
To: amsat
Subj: Pacsat telemetry change

In addition to the changes detailed for WEBERSAT yesterday, the new timestamp will also be added to the status line. PACSAT will be the first to receive this software upload, along with the latest battery routines.

You should, by the way, be seeing the batteries at a higher voltage, Bob is trying to keep them topped off, where the top is defined as 11.81V - 0.0216*Battery_temp.

A word about changes. The telemetry formats, and the format of other microsat data, such as the WEBERSAT image format, are subject to change. Sometimes it will be to add something we forgot, such as these timestamps, sometimes it will be to speed up the data transfer. Once the BBS is online, microsat telemetry will probably be in binary, and will be sent far less often. There will be a whole orbit data format, probably similar to the UoSAT format.

This is not meant to scare anyone off from writing software to decode microsat data, but be aware that things are in a state of flux. Make you software modular and flexible. For example, with over 240 analog telemetry values on four spacecraft, and 320 status bits, the best thing to do is have your program read the telemetry equation files sent out by Jan. Don't hard code the values in BASIC data statements, as you'll have to do a lot of typing as these values get refined, defined, or deleted.

Although the basic format of the basic telemetry will probably remain chan:val, the order of the channels, and presence or absence of any particular value is subject to change.

I'd like to suggest to the folks writing the all-singing all-dancing telemetry display and archive software that they do the following:

1) Define a standard microsat telemetry file storage format. This should be the raw telemetry count rather than converted, since the

equations may be adjusted, e.g., bat2 temp on dove. Write
the post-processing display, plot, and analysis software to run
off of the standard format.

2) Write a telemetry capture program(s) to convert raw data into the
standard storage format. Some of the already captured data is
in the N4HY format, some was dumped from monitor mode right into
a file.

AMSAT OSCAR-13 Transponder Schedule (valid until May 09)

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

However from the 21Feb90 to 21Mar90 there will be an
OFF period from MA 20 to MA 90 due to solar eclipses
affecting AO-13. The length of the eclipses vary from
12 to 89 minutes. There will be only Mode-B beacon
during the Mode-S from MA 195 to MA 200.
Spacecraft attitude on 03Feb90 was ALAT=207.1/ALON=+2.9,
which results in optimum Squint angle around MA200.

The 1990 annual meeting of Project OSCAR, Inc. was held on 27 January 1990
in Sunnyvale, California.

Elected to the Board of Directors for the 1990-92 term are:
Cliff Buttschardt, W6HDO
Ross Forbes, WB6GFJ
Clif Keeley, WA6JWA
Mike Marneris, K8ERL
Nick Marshall, W6OLO

Gary Nakayama, KH6JRB
Jeffrey Pawlan, WA6KBL

Officers for 1990 are:
Chairman of the Board - Gary Nakayama, KH6JRB
President - Ross Forbes, WB6GFJ
Treasurer - Gil Morris, WB6KCJ
Secretary - Margaret Nakayama, KB6HWV

Special Directors are:
Technical Director - Jeffrey Pawlan, WA6KBL
Director of User Services - Cliff Buttschardt, W6HDO

The BoD of Project OSCAR have expressed an increased interest in technical projects.

P.S. Doug, The following officers and board members of Project OSCAR are on TELEMAIL:
GNAKAYAMA Gary Nakayama, KH6JRB, Chairman of the Board
RFORBES Ross Forbes, WB6GFJ, President
CBUTTSCHARDT Cliff Buttschardt, W6HDO, Dir of User Services

888. Upgrading TNC-1 to higher speeds

>Mailer: Elm [revision: 64.9]

I have a TNC-1, that I would like to upgrade to 2400 or
higher baud rate. Does anyone have experience doing this, and could
say how well it works? I have heard 2400 is perfectly OK, but the
TNC tops out at 4800, is this true?

>

MILD FLAME:

I heard some of the original work on ACSSB about 10-12 years ago.
The presentation was at a professional conference and I was embarrassed
by it.
The talk was by the inventor of the concept Bruce ?.
A big deal was made of Bruce being a ham radio operator.
His talk was amateurish by even ham radio standards.

The ARRL jumped on the ACSSB bandwagon and
pushed it real hard as hams pushing the state of the art
and look here how important hams are.
Then as the limitations of the technology set in,
it seemed to die a good death until the UPS frequency grab.
I think that the ARRL contributed to the loss of 220 by
its push about 10 years ago of ACSSB.

I am not impressed by the concept and am not clear
why a spectrum efficient service needs additional spectrum to be implemented.
The original idea was to put the ACSSB signal in the guard band
between two NBFM signals and thus save spectrum.

Somewhere over the last 10 years, things changed.

MILD FLAME OFF.

From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <09.Feb.90.15
Source record: 13596

Packet-rates to support digital voice; i was not thinking of sending
the data in real-time. More a case of speaking your message into
a digitising PC with a TNC , then telling it where to send it, then letting
it get on with it, digitising and shipping the data in its own time.
Delays dont matter under these circumstances. they do not corrupt the
message!
Then when the message has arrived, the recipient replays the whole thing!
I agree that doing it in real-time would be silly unless you had loads of
bandwidth to play with. Perhaps it would be feasible
at UHF/Microwave though (where theres whole megahertz lying about unused....)
Voice-messaging is far more user-friendly than reading it on a screen. You
can speak all sorts of nuances that the written word will never express.
Damn it, you could have poetic QSOs, or even sing!

892. Re: NEW ICOM IC-24 MOD !

Newsgroup: rec.ham-radio
Date: 1990-02-09 15:28:28 UTC
From: larrys@cbnewsd.ATT.COM
Message-ID: <13120@cbnewsd.ATT.COM>
Source record: 13597

Per the posted information and current discussion on the modification of
the **new** ICOM 24AT dual band HT:

The Modification for freq. coverage extension:

1) Remove Diode D13

2) Keyboard [B,#,LIGHT] & Power-ON

Does work... FOR RECEIVE-ONLY!

The process is relatively simple; considering that most of the entire
radio is surface-mount parts... It turms out that Diode D13
is one of two "normal" sized diodes on the LOGIC BOARD easily
accessed and cut when the radio is opened...

(Two "standard" diodes are found below the logic IC1 by about
a 1/3inch, with IC1 at the top, looking at the diodes
D13 is the one on the left.)

Result: Recieve results (rough-info for about 6 hours of use after mod)

VHF: PLL begins to lock in at about 75mhz ...
and goes out of lock at about 280mhz
(display will go 0mkhz to 355mkhz)

UHF: PLL begins to lock in at about 355mhz
and goes out of lock at about 500 mhz...
PLL begins to lock in at about 795mhz
and goes out of lock at about 975 mhz...
(display will go 355mhz to 1310mhz)

Actual use/operation:

Aircraft: (108-136) seems to detect AM ok...
within 2 miles of Ohare Intl(ORD)
recieve of ground 121.--- moderate
receive of ATIS 134.--- good
recieve of tower and approach moderate
seems that high-end of band receives
better.
"looks like for a pilot who desires
to monitor ops at the port
prior to run-up or whatever
should work fine)

2m HAM: As shipped.
VHF HighBand (150-176): seems pretty hot-

unit is shipped rec'ing this stuff
220 mhz: VERY Dead receive at these freq.
hears only very-local transmitters
**ALSO above 200mhz step rate is
no smaller than 12.5khz
!!SO NOT ALL channels can be tuned
on freq- (UUCH!)
70cm (420-450): Fine
UHF (450-476): Hot reciever! - best ham mod'd receive
better than IC32AT mod rec...
470+ mhz works well-
chicago has allocations
of Public service and
business in 470-476
...and 24at works well
800mhz (convential/trunking):
Ah..it hears the band- perhaps
about the same as most
scanners- Not as hot as above
bands- BUT actual fairly
useable!
870-890 (cellular):
Yes, but channel step rate is 12.5khz
and cellular is on 30khz,
so can not be on exactly
every channel.
900mhz:
Did not check out much here...
did hear a few chicago
trunking systems at the
935 trunking band---
*also a lot of cellular images
present.

Bottom Line---
ICOM 24AT is a NEAT VHF/UHF/800mhz reciever and 2m/70cm
HAM radio in ONE.

The modification (D13 cut) provides a manner to receive
extended band coverage, without worrying about
accidental transmission in other services;
[however I would like to see 420-440 xmit at least
as I have repeater link/control in that
part of the HAM BAND; also 220 mhz freq&xmit
would be real neat; as well as 900mhz xmit
which a few repeaters do exist in the
area]

((((one only wonders what the next generation of HTs
will do???))))

AM as a modulation technique: yes the problems of phase distortion in SSB transmitters are rarely attended to by manufacturers. The phase-shift of the *whole* signal path (from microphone to speaker) should be considered - the number of components where there are frequency-dependent phase changes in a modern rig are considerable. Active audio filters, speech processors etc. are particularly bad in this respect. Similarly, the frequency response of many rigs is 'sub-optimal' to say the least. Small speakers and cheap microphones do not help at all. If the designers of audio stages took a few ideas from the more reputable manufacturers of quality audio amplifiers (and designed for low noise, low distortion, low phase-shift) things would sound much nicer. Properly set-up exciters and non-overdriven linears help even more. There is little to beat the overtweaked-exciter-into-a-not-too-linear-linear for generating horrible noises. Put a speech processor on the input and the results have to be heard to be believed.
On bands where there is little crowding, double-sideband-with-carrier AM is perfectly sound as a modulation method. And it can sound so nice!
No hiss, squawkiness or scratching.... (just S9 QRM from thermostats)
Must dig out my old 2meter rig... 829B double-tetrode modulated by a pair of 6L6 in push-pull... 50 watts of smooth, mellow audio happiness!

This is a very good point, and emphasizes the need for individuals to have some skill in morse code. However, it does nothing to justify the need to learn 13 and 20 wpm in order to gain SSB privileges. If speed and efficiency of communication are the issues, CW is not the proper mode. If it is just a hoop for operators to jump through, better operators would be made by required airtime and more comprehensive testing on techniques, protocols and procedures.

FASTER CODE DOES NOT EQUAL BETTER OPERATORS.

Wow!, you mean that finally in 1990 the US is going to follow
the proposal from the 1947 Atlantic City WARC and have no-code
30 Mhz and above?

That will leave just Bermuda demanding code? As I recall, most
countries allow no-coders above 30 Mhz. Yes there are exceptions,
as I recall, Russia allows them on parts of 10 Meters, Japan has
some low power no-coders on HF. Otherwise, like the Metric
system, everyone but the US is doing it.

Your Metric and no-code bigot

Yesterday the ARRL put out bulletin 7 (2/8/90) dealing with the
FCC proposal for the codeless license. Amazingly, they want
to DISCONTINUE the Novice license in favor of the new codeless
license!

Dave Sumner of the ARRL sent me the text of the FCC release.

73,
Tad Cook
tad@ssc.UUCP
KT7H @ N7HFZ.WA.USA.NA

Date: Fri Feb 09, 1990 5:37 am PST

From: David Sumner / MCI ID: 264-6149

TO: * Paul Cook / MCI ID: 328-8544

Subject: RE: ARRL Bulletin #7

Dear Tad:

Since you have MCI capability, perhaps the best way to address your

question is to send you the full text of the FCC news release. (The

actual Notice of Proposed Rulemaking is not yet available.)

Everyone should bear in mind that this is an FCC PROPOSAL only.

73,

Dave K1ZZ

Report No. DC- ACTION IN DOCKET CASE February 8, 1990

FCC PROPOSES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE

(PR DOCKET 90-55)

The Commission is proposing to amend its rules by establishing a

codeless class of amateur operator license to be called the

Communicator Class. The Communicator Class would be incorporated into

a simplified licensing structure containing four ascending steps:

1) Communicator 2) General, 3) Advanced, and 4) Amateur Extra Classes. Current Technician and Novice Class operator licenses would be grandfathered indefinitely, with no new licenses issued for those license classes but existing licenses could be modified or renewed. The codeless operator class license would satisfy three major objectives. The first objective is to offer an entry level license for all persons who find telegraphy a barrier to pursuing the purpose of the amateur service. The second objective is to design a codeless license that can easily be implemented into the current licensing process. The third objective is to avoid any negative effect upon current licensees, the volunteer examiners who administer amateur examinations, or the Commission's workload.

The amateur service exists for the purpose of self-training, inter-communication and investigations to be carried out by duly authorized persons interested in radio technique solely with a personal aim, and without financial gain. Individuals seeking a license to operate an amateur station must prove that they can send correctly by hand and receive correctly by ear, text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz, each of the five classes of operator licenses issued by the Commission requires the applicant to pass an examination in the international Morse code.

The Communicator Class operator license would not require knowledge of Morse code telegraphy messages. Privileges for the Communicator Class would include all emission types. The Communicator Class license would replace two existing beginner operator classes and would simplify the amateur operator license structure.

The Commission would require applicants for the Communicator Class license to pass a 60 question written examination. The new question pool would be comprised of the questions from the two pools currently

used in the Novice and Technician license examinations as well as the addition of new questions.

The proposed transmitter power for the Communicator Class would be 200 watts peak envelope power and the licensee's station would be eligible for a Group D call sign. Stations with Communicator Class control operators would not be permitted to transmit on the 2 and 6 meter VHF bands and the HF bands. The Commission is requesting comments on the effect of excluding Communicator Class licensees from the two VHF bands. Comments are also requested on the desirability of including the opportunity for Communicator Class licensees to experience on-the-air telegraphy operation on the HF bands. Additionally, a Communicator Class licensee who passes or receives credit for a telegraphy examination would be authorized the privileges of the Technician Class.

The Commission is requesting comments on all aspects of this proposal.

Action by the Commission February 8, 1990, by Notice of Proposed Rulemaking (FCC 90-55). Commissioners

Oh yes there is! The very idea that someone "needs" 20 WPM skills in CW to be granted an EXTRA is old-age thinking. There is simply no excuse for any form of CW skills test beyond 5 WPM. In the earliest day of licensing, the requirement was only 5 WPM! In short, it's only the status-quo mentality of the OF's in Amateur radio via the ARRL, that keeps the 13 & 20 WPM skills test alive. There is nothing whatever about the ITU requirements that would prevent the scrapping of these CW tests.

Besides, think about it...a no-code license for vhf-uhf, and a simple 5 WPM for all other levels. It would simplify things a great deal. And after all, the hobby is supposed to be about T E C H N O L O G Y not blazing-brass! ;-)

901. Who needs another license class?

Newsgroup: rec.ham-radio
Date: 1990-02-09 20:40:48 UTC
From: FNDDR@ALASKA.BITNET
Message-ID: <9002100808.AA29629@ucbvax.Berkeley.EDU>
Source record: 13606

Oh boy, a free-for-all. As long as things are stirred up, how about this suggestion:

Instead of setting up a new no-code license, why not simply abolish the 5WPM requirement for Novice and Technician licenses? Simple to implement, and no-code licensees wouldn't be singled out for abuse by hardliners.

I know the objection everyone is thinking of: international law requires a knowledge of morse code to operate in the HF bands. But consider this: all novice/tech permissions in HF are cw-only (except for the bit in the 10m band, which doesn't count...many countries have no-code licenses around 30 MHz, such as our citizen's band). The point is, any Novice/tech who would want to operate on HF would have to use morse code, and thus would be in compliance with international law...those who wanted to live code-free could get on with life above 30 MHz. I bet that a sufficiently-motivated lawyer could make this argument stick.

I can think of various advantages to this approach:
- on-air code practice. Instead of sitting around listening to a tape or computer, code could be learned on the air. As it stands now, people studying for novice are stuck being passive listeners, a very boring way to learn code.
- abolish 5WPM forever. Many people, including me, feel that 5WPM is so unnaturally slow that it discourages novices and creates an artificial learning hump when trying to upgrade to 13 WPM. Without being brain-washed (and I think brain-damaged) by learning 5 WPM, learning 13 or 20 WPM directly could be a lot less traumatic.
- I think cw is widely perceived to be a barrier by hams and prospective hams SIMPLY BECAUSE WE ADVERTISE IT THAT WAY. The attitudes expressed here and in the ham magazine letters columns often boil down to "you must learn the code or you are not a Real Ham." This kind of elitism turns hams away from using cw (it turns me off), and turns non-hams off about being hams. If the first levels of ham licensing were no-code, hams could become interested in it gradually and naturally, rather than having it shoved down their throats. Let them become interested in working satellites with cw, or in weak-signal work, or exotic dx...cw could become more popular than ever if we could get rid of the bitterness and the "do-it-or-else" attitude.
I've got a nasty feeling that the proposed no-code license will turn into a joke, with written tests that will keep out all but a few graduate engineers, or with a "second-class-citizen" stigma attached to it. I'd rather see reform in the existing structure than have a new layer added to it.
Happy fighting,
Don Rice

This brings up an interesting question in which, perhaps, my own personal
experiences may be of interest.

I was licensed at the age of 12, and was very active on cw as a teenager,
reaching a code proficiency level of 40 wpm. At 18, I went away to
college and, like many others, gave up ham radio completely. About 10
years later, I wanted to take an FCC examination for a Commercial
Radiotelegraph License. The code portion consisted of two tests.
One test required perfect copy for 1 minute (out of 5) of plain text
at 25 wpm, including punctuation not required on ham exams(; - ( ) "
!). The second test consisted of 5 letter/number code groups, again
requiring 1 minute perfect copy at 25 wpm.

I bought a tape recorder and some code practice tapes and set aside
15 minutes a day to practice. I was not at all intimidated by the test
and I had no doubts about being able to pass it, but I was curious to
know how much of the code I had forgotten and how long it would take to
recover my cw ability. I gave myself 6 weeks to get up to 30 wpm.

I was very surprised to find that after only 10 days or so of practice
15 minutes a day, I had no trouble copying 30 wpm. It seemed that the
code was like a native language which I hadn't spoken for 10 years,
but that I had never really forgotten either. It came back almost
instantaneously.

I am looking for a good (read cheap :-)) digital thermometer for tracking temperature in my office. I've got the build-it bug right now so this would be a good project.

Please respond directly to me. I'll post a summary if the volume warrants it.

Thanks in advance!

The 6MJ6 is similar to the 6LQ6 and 6JE6C - they are all pin-for-pin interchangeable. I have the specs for the 6LQ6, and will dig it up if this is good enuf. I've got an amp that has several of each kind, and haven't noticed any differences in drive vs. plate currents.

Don't be bothered by the high input SWR, if the RF IN goes directly to the cathodes. The cathode capacitance to ground is really big for several sweeps in parallel. I've measured 3:1 on 80 meters to about 5:1 on 15 meters. I'm tinkering with an input circuit now; I'll publish it when I find something that works. I tried to match it with an MFJ tuner, but could only get it down to about 1.5:1. Apparently, SWR changes with input power.

Tube current balance is important in these parallel configurations. A 10-ohm resistor in the cathode should help to equalize it. I resorted to DeMaw's method (QST ca 1970) of individually biasing each tube, then balancing them at maximum output. At -20 V control bias and 800 Vp, I'm running Class C, 65% eff, and over 400W (meter only goes to 300 :-o).

Since the amplifier presumably worked at one time, suspect a worn-out tube. You could try removing drive from one tube at a time and checking output power. Another option is to individually meter each tube and see if they are imbalanced. Don't bother with tube testers - I had a couple deadbeats that looked ok on the tester. Apparently, high drive is different from static conditions :-)

I had a question about the talk of how code can be useful in cases of being buried in an earthquake, etc., by tapping messages with rocks or pipes.

But what I wonder is, how can you recognize this? Dots and dashes would sound the same. Or at least, you couldn't really tell a dash from a dot and a space. How do you this?

^^^
Aerotron and others started it. UPS just jumped on the user bandwagon.

> I think that the ARRL contributed to the loss of 220 by
> its push about 10 years ago of ACSSB.

Why is it not the case that the hams' rejection of ACSSB over the past
10 year contributed to the loss of 220?

> I am not impressed by the concept and am not clear
> why a spectrum efficient service needs additional spectrum to be implemented.

No one would use it. It's not quite as good as FM, so why use ACSSB on a
frequency you can use FM? (see below)

> The original idea was to put the ACSSB signal in the guard band
> between two NBFM signals and thus save spectrum.

They are bunched together pretty tightly now. The guard band is really
almost non-existant.

1. There is a demand for unavailable spectrum in major metro areas.
2. Users won't use ACSSB if they can use FM (cheap equipment, etc).

So by getting some "virgin" spectrum, they can force some people to try
ACSSB long enough to "prove" it workable. These users will be glad to
have some spectrum and would be happy to use ACSSB just to get it.

The FCC cannot just toss out FM until ACSSB has been proven to work in
actual land mobile services.

909. FCC release on no-code proposal

Newsgroup: rec.ham-radio
Date: 1990-02-10 02:58:22 UTC
From: karn@ka9q.bellcore.com
Message-ID: <19917@bellcore.bellcore.com>
Source record: 13614

Here's the text of the news release on the FCC's no-code proposal, as downloaded from Compuserve. It looks like my rumor source was only partially correct; note that this proposal excludes 6m and 2m from the Communicator class, but specifically requests comments in this area. --Phil

From the FCC News Release, 2/8/90:

FCC PROPOSES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE
(PR DOCKET 90-55)

The Commission is proposing to amend its rules by establishing a codeless class of amateur operator license to be called the Communicator Class. The Communicator Class would be incorporated into a simplified licensing structure containing four ascending steps: 1) Communicator 2) General, 3) Advanced, and 4) Amateur Extra Classes. Current Technician and Novice Class operator licenses would be grandfathered indefinitely, with no new licenses issued for those license classes but existing licenses could be modified or renewed.

The codeless operator class license would satisfy three major objectives. The first objective is to offer an entry level license for all persons who find telegraphy a barrier to pursuing the purpose of the amateur service. The second objective is to design a codeless license that can easily be implemented into the current licensing process. The third objective is to avoid any negative effect upon current licensees, the volunteer examiners who administer amateur examinations, or the Commission's workload.

The amateur service exists for the purpose of self-training, inter-communication and investigations to be carried out by duly authorized persons interested in radio technique solely with a personal aim, and without financial gain. Individuals seeking a license to operate an amateur station must prove that they can send correctly by hand and receive correctly by ear, text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz, each of the five classes of operator licenses issued by the Commission requires the applicant to pass an examination in the international Morse code.

The Communicator Class operator license would not require knowledge of Morse code telegraphy messages. Privileges for

the Communicator Class would include all emission types. The Communicator Class license would replace two existing beginner operator classes and would simplify the amateur operator license structure.

The Commission would require applicants for the Communicator Class license to pass a 60 question written examination. The new question pool would be comprised of the questions from the two pools currently used in the Novice and Technician license examinations as well as the addition of new questions.

The proposed transmitter power for the Communicator Class would be 200 watts peak envelope power and the licensee's station would be eligible for a Group D call sign. Stations with Communicator Class control operators would not be permitted to transmit on the 2 and 6 meter VHF bands and the HF bands. The Commission is requesting comments on the effect of excluding Communicator Class licensees from the two VHF bands. Comments are also requested on the desirability of including the opportunity for Communicator Class licensees to experience on-the-air telegraphy operation on the HF bands. Additionally, a Communicator Class licensee who passes or receives credit for a telegraphy examination would be authorized the privileges of the Technician Class.

The Commission is requesting comments on all aspects of this proposal.

> reaching a code proficiency level of 40 wpm. At 18, I went away to
^^^^^^^^^^^^^^^

> college and, like many others, gave up ham radio completely. About 10
^^^^^^^^^^^ ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

WHY ???

I know I will hear stories about things like classes and stuff. But I also know college students will be college students and will find time to do other things than just study. And besides, the SMARTER ones won't have to study as much because most of the material is understood in the first pass.

Colleges and Universities have ham radio clubs. If yours does not, then start one. Just because dorm rooms don't offer much chance to operate does NOT mean its time to just give up on ham radio. Use a club station.

[SAVE THIS POSTING: it has directions for getting on a mailing list]

I see some problems with the FCC proposal as it was posted here. It is not hopeless, and the fact that the FCC is seeking more comments means that it can be fixed if we act sensibly on this.

The fact that the Technician license class is being removed from further availability means that those who wish to do what the Communicator cannot, such as:

1. Operate 1500 watts above 30 Mhz
2. Control repeaters (I'm not sure if the FCC proposal denies this to Communicators).
3. Operator 6 meters and 2 meters.

will have to learn Morse Code at 13 WPM for the General class, instead of the 5 WPM the Technician class currently requires.

Additionally, the entry level for HF privileges is totally removed. One must JUMP to 13 WPM. There remains no 5 WPM level unless the FCC decides to change General to 5 WPM, and I am sure that would meet MUCH resistance.

One "FIX" is to make the Communicator class have ALL amateur privileges on frequencies above 30 Mhz and keep the Novice class and allow one to hold BOTH Novice and Communicator classes in a single license (the dual class idea was proposed to the Commission in my petition).

There is sure to be discussion and debate on this issue, both between those opposed to any changes altogether, and those who want a change, as well as between those who want a different change, and those who like this one. I suggest these discussions take place on the HAMLICEN mailing list.

You may subscribe to HAMLICEN by sending mail to: listserv@vmd.cso.uiuc.edu saying "sub hamlicen <your name & call>" in the text (NO SIGNATURES). You may send your postings/contributions/ideas to: hamlicen@vmd.cso.uiuc.edu

913. 1990 GMRS Repeater Guide Published

Newsgroup: rec.ham-radio
Date: 1990-02-10 18:30:02 UTC
From: rh@well.sf.ca.us
Message-ID: <16086@well.sf.ca.us>
Source record: 13618
Cross-posted to: rec.radio.shortwave,rec.ham-radio

The 1990 edition of the General Mobile Radio Service (GMRS) "National Repeater Guide" has just been published by the Personal Radio Steering Group (PRSG). This 9th edition describes more than 1,000 GMRS repeater systems and monitoring watches in all 50 states and Puerto Rico.

Since a rule-change at the start of 1989, new GMRS licenses are available only to private individuals for personal, family and business communications. It is one of the fastest growing land mobile services.

Many repeater systems listed in the Guide are operated by nonprofit community-service radio teams and user cooperatives. The Guide also lists hundreds of GMRS stations operated by local governments and quasi-public agencies that licensees can call for assistance while passing through the area. Many listings include signaling data and station characteristics, as well as contact names, addresses and telephone numbers. Besides station listings, the Guide features an extensive introduction and tutorial on the history and capabilities of GMRS.

The Personal Radio Steering Group Inc. is the national service organization for GMRS licensees. The PRSG publishes the monthly "Personal Radio Exchange" for GMRS users, as well as instructional materials on licensing, radio purchasing and interference resolution. The PRSG computer BBS brings subscribers the latest GMRS news, and provides a forum for discussion among licensees.

The GMRS National Repeater Guide is available from the PRSG for $10.00 (postage included), or is included with the $30.00 "Personal Radio Exchange" newsletter subscription.

=========

MONDAY FEBRUARY 12, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED distribution.

* MOS-1b LAUNCHED! *
====================
Marine Observation Satellite 1-b (MOS-1b) was successfully launched from Tanegashima Space Center at 10:33:00 JST (UT+9h) on February 7, by an H-1 rocket. All separation phases for MOS-1b, DEBUT (Deployable Boom and Umbrella Test) and JAS-1b (Japan Amateur Satellite-1b) were confirmed.

After the launch, the three payloads were nicknamed as follows:

MOS-1b MOMO-1b (MOMO means peach in Japanese)

DEBUT ORIZURU (ORIZURU means crane shaped by folding paper in Japanese)

JAS-1b FUJI-2 (FUJI has two meanings in Japanese: Mt. Fuji and wisteria)

Missions:

MOS-1b

* Continue overall earth observations by Multi-spectrum Electronic Self-a scanning Radio-meter, Visible and Thermal Infrared Radiometer, Microwave Scanning Radiometer and Data Collection System.

* Establish earth observation satellite operation technology including two satellite parallel operation.

* Establish sun-synchronous orbit injection technology by H-1 launch vehicle.

Piggy Back Payloads

DEBUT

* Deployable Boom and Umbrella Test (DEBUT) Satellite is the payload which performs function verification experiments in a space environment on a boom mechanism capable of being extended/retracted and an aerodynamic umbrella capable of being opened/closed.

JAS-1b

* JAS-1b (Japan Amateur Satellite-1b) is a satellite which facilitates
worldwide satellite communications by amateur radio.
The launch of JAS-1b enables amateur radio operators to learn about space
science and satellites, also to understand space communication. JAS-1b will
become the successor of JAS-1/Fuji-OSCAR 12, the Japan's first amateur
satellite launched in 1986. This spacecraft is now known as OSCAR-20.

Orbit:

MOS-1b Altitude approx. 909km
Inclination approx. 99deg
Configuration Box type attached with cantilever
type solar paddle: main body 1.26x1.48x2.40(m)
solar paddle 2.00x5.28(m)
Weight approx. 740kg (at launch)
Mission life 2 years

DEBUT Altitude elliptical approx. 900x1600(km)
Inclination approx. 99deg
Configuration stored: 400mm in diameter(26-side
polyhedron) 470mm in length (structure+boom+
aerodynamic umbrella)
Weight 50+/-1 kg
Power Subsystem Battery: Lithium battery (capacity 95 Ah)

Design Service Life approx. 10 days (due to life
of the internal primary battery)

JAS-1b Altitude elliptical approx. 900x1600(km)
Inclination approx. 99deg
Configuration 440mm in diameter. 470mm in length
Weight approx. 50kg

(Sources: NASDA Information for Press and personal communication)

[From: Yoshiro Yamada of the Yokohama Science Center, Japan]

* SHUTTLE NEWS *
================
Launch of Atlantis and the STS-36 mission is scheduled for 22-Feb-90.
This will be a DoD mission, and the orbital inclination is expected to be
62 degrees.

* PACKET BID$ *
===============
The packet radio bulletin IDs (BID$) used for SpaceNews have been modified to
allow greater flexibility in distribution. Longer bulletins can now be broken
into multiple parts, each having a unique (but related) bulletin ID without
exceeding the eight character BID$ limit.

The format for the new ID is as follows: SPCmmddp

...where mm=month number, dd=day of the month, and p is an optional character identifying the bulletin part (a, b, c, etc) in case the bulletins are broken into multiple parts.

* FEEDBACK WELCOMED *
==========
Feedback regarding SpaceNews can be directed to the editor (John) via any of the following paths:

Sb: Final Mods - Yaesu FT 101E

PACKET BID: 44022_VE3JF

Here's an old modification that's been around for a few years. I had occasion to use it recently myself, so it may be of value to someone else I am not sure of its origin, I may have picked it out of an old QST. Anyway, it works.

73 -Bob- VE3OSN @ VE3JF

REPLACING FINALS IN FT101E TRANSCEIVERS

There will come a time when the finals in your FT101E will need replacing. These transceivers were originally equipped with 6JS6C tubes manufactured by NEC. This tube's properties are slightly different from the 6JS6C tubes available today from American tube manufacturers. By the way, don't bother looking for tubes made by NEC. They got out of the business several years ago.

In order to use the "American" variety 6JS6's, a simple modification to the neutralization circuit must be made to the final section of the transceiver.

The modification consists of replacing the fixed value 100 pf 1000 VDC mica capacitor with a 10 pf 1000 VDC mica capacitor. This capacitor, C125, is in series with the 10 pf variable neutralizing capacitor off of the plate circuit.

If this modification has not already been completed on your rig, be sure to use a mica or silver mica of at least 1000 VDC. Do not substitute a different type, because the heat in the final compartment will change the value, and your tubes will fail prematurely. Also, be very careful to keep all leads short and in exactly the same orientation as the original capacitor.

Before reneutralizing, open the variable neutralizing capacitor all the way to minimum engagement and follow the neutralizing instructions in the manual. While dipping the plate, remember to adjust the neutralizing capacitor for equal value meter reading peaks (IC position) on both sides of the dip when tuning the "Plate" control.

Sb: TM731 Mod.

For those that want to know how to enable the repeater fonction.
"FONCTION" "ABC"
73 de VE2BCM Gerald
0122z, 1889 msgs, #17926 last @KD6TH-4 MailBox>

Above received with word repeater spelled "reoeter", I assume he meant to say repeater. I haven't tried this. Don't look at me if this blows up your radio WA2ISE (can't see how it could, but ...)

920. Letters needed to fight FCC censorship

Newsgroup: rec.ham-radio
Date: 1990-02-11 10:30:13 UTC
From: marc@noe.UUCP
Message-ID: <776@noe.UUCP>
Source record: 13625

I am posting this for a friend of mine.
-Marc
marc@kg6kf.ampr.org

Responding to pressure from Senator Jesse Helms and other
right wing influences the FCC is trying to ban from the
airwaves anything it characterizes as indecent. While refusing
to define this term in a way that would allow broadcasters to
know in advance whether they have violated the regulation, the
FCC is broadening it to include indirect or symbolic innuendo,
and eliminating previous presumptions that material not suitable
for children could be broadcast between 10 pm and 6 am when
children would be asleep.

Under a cover of a war on indecency, this action represents the
rankest form of government censorship and intimidation of broadcasters.
Unless you believe that the public mind should be limited to material
suitable for children, this is a threat to your ability to receive
anything other than pablum over the airwaves. In addition to being
a set of vague rules used selectively against particular broadcasters
these rules are used to inhibit serious discussion of important
contemporary topics (abortion, AIDS, teen pregnancy).

Please help out by sending a letter (anonymous if necessary)
to the FCC informing them that their role should be limited to
ensuring that broadcasters meet technical specifications and do not
interfere with each others channels. Tell them they have no right
to limit, censor, or determine program content.

Please send your letter to arrive before the proposed rule making
on February 20, 1990.

It's no longer up for debate. The FCC has put us on notice: "Take your pick, no-code or no ham radio". Those who think the threat is a bluff need only review the recent loss of 40% of the 125 cm. band.

I see no virtue in excluding the Communicators from 6 meters, especially if we're serious about using the no-code license to bring "digiters" into the ranks. Two reasons: 1) six is good for meteor propagation, and 2) terrestrial propagation is favorable for using six for intercity, even crosscountry links.

Why ridiculous? I was under the impression porthole covers were made of a
rather good grade of glass.

I'll vote for that. It's a very sensible solution. The satellite users will
bitch, but there are better bands for that anyway.

I would like to file a comment on the proposed no-code license class.
Could someone please post an article describing the proper way to do
this, including format and the docket number for this issue?

Thank you.

Mark

I removed the D13 diode from my IC-24AT, serial number 1025, and it does enable extended receive ranges. Those below the aircraft band, however, do not actually receive the displayed frequency.

If the more extensive mod works better, someone please post results.

Regarding Marc's comments on the FCC crusade against "indecency":

It's sad that the courts have let this one go as far as it has. The rule of law in the US has always included two key safeguards: freedom of speech, as guaranteed by the First Amendment, and the requirement that laws be written in clear and unambiguous language so that everyone can (at least in theory) know in advance whether or not their intended conduct is proscribed.

In my opinion, EVERY law and rule against "indecency" or "obscenity" fails on both counts. I can't remember which Supreme Court justice made the famous comment "I can't define pornography, but I know it when I see it." No other statement could have better shown the fundamental conflict between attempts to control obscenity and the "rule of laws, not of men" principle that judges are supposed to uphold as a check against demagogic legislators and executives.

To be sure, many laws against obscenity HAVE been thrown out by the courts either on First Amendment grounds or because they were vague. But I won't be satisfied until "many" becomes "all". Obscene speech, like flag burning, may be offensive or impolite to some, but that doesn't mean it's okay to pass laws against it. You can't legislate manners.

Phil

The AMSAT Board of Directors (of which I am a member) is on record as supporting a no-code license with full privileges above 30 Mhz. Among other things, we want them to have access to the Microsats now in orbit (they listen on 2 meters).

From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9002120803.AA22942@ucbvax.Berkeley.EDU>
Source record: 13535

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

931. ARRL contest question

Newsgroup: rec.ham-radio
Date: 1990-02-11 20:35:23 UTC
From: oo7@utastro.UUCP
Message-ID: <4804@utastro.UUCP>
Source record: 13536

Can anyone explain, or rather, justify, the scoring system used in the ARRL DX contests (e.g. the one this coming weekend)? Each QSO between a W (or VE) and a DX station counts 3 points for each station. Why 3?

These are the only contacts allowed (W/VE vs 'DX'), it's not like the CQ WorldWide ones where W's get 3 points for a DX contact but only 2 for a contact with other N. American country, or Field Day where cw and ssb contacts count different numbers of points.

So why 3 points for everyone? Why not just one? Or 17? Or 23,489?
The only reason I can think of is to make the total scores comparable to those in e.g. CQWW, where the average points per QSO is close to 3. This makes a little (twisted) sense, although the CQWW and ARRL contests are sufficiently different (less activity by non-W/VE stations) that the scores are unlikely to be similar anyway.

Or is the reason lost in the mists of time, and in the past the scoring system did include only 1 or 2 points for something other than a W/DX QSO?
I'm not trying to start a thread along the lines of "contests are silly anyway, why should the rules be sensible?" - although that may well be the answer :-)

932. Kenwood 731a mods

Newsgroup: rec.ham-radio
Date: 1990-02-11 23:46:38 UTC
From: jim@mmsac.UUCP
Message-ID: <4589@mmsac.UUCP>
Source record: 13537

I bought a 731 yesterday, and performed the mod that involves moving one resistor and clipping another for out-of-band operation. Well, removing the one chip resistor does enable the cross-band repeater function, and that works like a champ, and clipping the other resistor does enable out-of-band reception, but it still doesn't allow out-of-band transmission. I have a business repeater on 461 that I'd like to be able to access with the 731, but I can't. Transmission out-of-band on the VHF portion doesn't work either. If there is someone out there who has successfully modified a 731 (not a 721) for out-of-band transmit, please let me know. I could use some pointers. I don't have a technical reference manual, just the schematic that came with the radio.

933. Re: Some common Pro-Code Myths Debunked

Newsgroup: rec.ham-radio
Date: 1990-02-12 01:03:47 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002120103.AA00596@cmr.ncsl.nist.gov>
Source record: 13538

I have a few PROBLEMS with a posting in Vol 90 Issue 168 by
shelby!neon!bodega.stanford.edu!paulf@decwrl.dec.com (Paul Flaherty).
There is enough controversial about no-code without mis-statements.....

> Subject: Common Pro-Code Arguments Debunked
..... stuff left out ....
> I have maybe five CW
> contacts in my log, compared with hundreds of hours of sideband hf.

> Now then, on to some of the more interesting myths:

> 1. A1A is more power efficient than J3E.

> Unfortunately, this comparison is usually made on the basis of bandwidth
> alone. It ignores the enormous amount of redundancy in the human voice.
... stuff left out ....
> All things considered, the modes are about equal to a trained operator.

PLEASE EXPLAIN WHERE THE EME AND OTHER VHF / UHF WEAK SIG CROWD IS GOING
WRONG, THEY SEEM TO FIND SSB UNREADABLE UNLESS SIGS ARE "STRONG". I'M SURE
THEY WOULD rather USE VOICE, I KNOW I WOULD.

> 2. CW rigs are easier to build, and easier to get parts for.

> Well, perhaps if you build things from discrete components, but these days,
> anyone can get the appropriate modules and ICs through the mails. Anywhere
> there's postal service, you can order from Digikey or a host of other mail
> order outfits. If you want to play with stone age technology, fine, but
> don't beef about it. The newer stuff is simpler to design with, and
> cheaper, and above all, just as easy to get.

"IMHO", THESE "wonder modules" MAKE EVEN CW XMTRS EASIER TO BUILD, AND THEY
THUS REMAIN CONSIDERABLY SIMPLER THAN ANY SSB RIG. OK, FM XMTRS CAN BE
ABOUT AS SIMPLE AS CW, AND VERY-LOW-POWER AM W/CARRIER RIGS AREN'T SO BAD.
BY THE WAY, WHERE DO I ORDER COMPRESSION MICA TRIMMERS (LIKE ARCO 464)? I'M
CERTAIN SOMEONE STOCKS THEM, BUT THEY AREN'T IN DIGIKEY, NEWARK, ETC. I
NEED SOME FOR A VHF SOLID-STATE FINAL.

..... Lots left out .....

> I'll happily debunk more myths as they appear.

I'M EAGERLY AWAITING YOUR NEXT POSTING.

It's exactly like Publisher's Clearinghouse, where everyone has "six chances
to win!". Next question?

> ((((one only wonders what the next generation of HTs
> will do???))))

NOT MORE than the higher of:
1. What is useful in Japan
2. What we convince the Japanese is worth selling here (after we convince the sales people at the American offices to be a bit more than just sales people, and they are stubborn).

Sales people as a rule are only interested in selling you WHAT THEY HAVE to sell you. They are NOT interested in what you would rather have, since they might be selling vacuum cleaners tomorrow. It's too bad the deisgn people depend so much on the sales people to inform them of what is needed. At least in Japan, the design people themselves are often a part of what is going on, and radios will reflect much of the interest in Japan even if the sales people don't pass on anything. For American and European needs, we either have to get the sales people to pass the information on (and they have so far only given excuses of why they can't) or just BYPASS THEM.

> be granted an EXTRA is old-age thinking. There is simply no excuse for any
> form of CW skills test beyond 5 WPM. In the earliest day of licensing, the

IMHO, you are correct EXCEPT for a license class that WOULD (since no such
class exists) granted MORE code privileges ONLY.

Having to pass 20 WPM code to get more VOICE or RTTY privileges is stupid.

> requirement was only 5 WPM! In short, it's only the status-quo mentality of
> the OF's in Amateur radio via the ARRL, that keeps the 13 & 20 WPM skills
> test alive. There is nothing whatever about the ITU requirements that would
> prevent the scrapping of these CW tests.

I'm not against having a small subband of some HF bands set aside for the
CW elitists. Let them learn their 20 WPM and get that subband. Better yet,
make it 35 WPM.

> Besides, think about it...a no-code license for vhf-uhf, and a simple 5 WPM
> for all other levels. It would simplify things a great deal. And after all,
> the hobby is supposed to be about T E C H N O L O G Y not blazing-brass! ;-)

Yeah, you're so right.

But would you still keep 50.0-50.1 and 144.0-144.1 as CW only subbands?
Remember, its only some VHF bands that have REAL CW ONLY segments!

Actually things would be more flexible and simpler if we just went to
subbands based on emission bandwidths.

RE: Re: 2004/2005 modifications

While we are on the subject of modifications, could you tell me how to increase the usability of a Bearcat BC 200XLT hand held? Unlocking the 800 MHz band is my primary concern. Also, since this scanner is unable to scan at 30 spacing, how will this affect it's use in the 800 MHZ band?

Mark

> and seeing his statement that the Morse test is the only thing keeping
> him from becoming a ham, maybe keeping Morse isn't such a bad idea....

Somehow I get the impression you don't want him to be a ham. Why?
Can you explain just what the character of personality is that is not
good for ham radio? Can you prove it? If you can, I will gladly
petition the FCC to add a personality profile exam to the other
stupid test we now give to try and filter the good from the bad.

> I noticed in the ARRL bulletin #7 that the FCC finally came out with

We could just make General 5 WPM. It would be a fine entry level.

Here is another set of classic arguments and their rebuttals:

--- International agreements require a Morse Code exam.

This arguments fails on two counts. First of all, the actual wording of the agreement is vague. It says "knowledge of Morse Code" is what is required. The second, and most important, is that the agreement applies only to licenses granting privileges to operate below 30 Mhz. Since the codeless license proposals only grant privileges well above 30 Mhz, this argument does not even apply to the proposed new license class.

--- Morse Code is a tradition in Amateur Radio.

This is correct. But every phase of advancement in Amateur Radio has its own traditions. The belief of many is still that good traditions are to be honored and respected, not shoved onto people. Morse Code has a place in Amateur Radio, and always will. The traditional license classes will still continue to require a Morse Code exam under most proposals.

--- Morse Code will keep the "riff-raff" out of our bands.

This is not likely to be so. There is already a lot of "riff-raff" in the Amateur bands. Hams have their bad apples, too. While some people who would be "riff-raff" might be turned back by a code exam, if they were interested in leaving the CB channels, they probably would be operating illegally anyway. We just lose a chance to turn them around.

--- CB and GMRS is available for people who won't learn Morse Code.

This is not true. The CB and GMRS services are not appropriate for technical experimentation; the Amateur service is clearly the place for such things. FCC rules part 97.1 spell this out very clearly.

--- A No-Code license just lowers the requirements for a license.

Since some proposals for a new license class increase the level of the written exam beyond that of the Technician, and grants fewer privileges than the Technician has, the argument is clearly false.

--- Morse Code ensures that only the dedicated will get licensed.

If someone is interested in Morse Code, the exam is no barrier to them. If they are not interested in Morse Code at all, then it is a barrier to them just as much as having to learn any other unrelated subject. Since many people intend to not ever use Morse Code, then it is just as unrelated to them as learning how to drive a team of horses or pilot an oil tanker around ocean reefs.

--- Morse Code is easy to learn.

Clearly this argument, which is truthful for a large number of people, is a contradiction to the argument that the Morse code exam helps keeps out "riff-raff". Many things are easy to learn, but no one is expected to learn everything. Just because something is easy to learn does not say why it must be learned.

--- 5 WPM is not a barrier for anyone seriously interested in ham radio.

Neither is a written exam on the technical characteristics of packet radio, but we would not expect to force everyone to learn these things even though most hams could if they just put their mind to it.

--- Studying Morse Code exposes new hams to a mode they might like.

Studying anything can expose anyone to something new and exciting. Why must Morse Code be singled out to force everyone to be exposed to it, and other modes don't get similar exposure? People can be exposed to everything by just participating in Ham Radio itself. If you turn someone away immediately, then will never have a chance to become interested in anything particular in ham radio. The testing process is not supposed to be an advertising and brainwashing process for new recruits.

--- Studying Morse Code forces discipline on new hams.

Far more discipline, and useful discipline, is learned by actual radio operation. Would accept someone who passes all the test elements for the Extra class as a ham if they decided that they didn't need to even operate and are fully skilled already as a ham? Of course not.

--- Morse code is necessary for emergency communications.

More communications is now taking place in other modes, and many hams, including an increasing number of Technicians, don't use or are even capable of Morse Code operation. Emergency communications still take place, but use primarily voice and packet modes.

--- We need a trained pool of skilled CW operators.

For what purpose? There will always be a number of people interested in operating (and thus learning) Morse Code. Why is it necessary to train everyone, when most of the people who would be licensed under the new proposed license class would just forget the code if they had to learn it otherwise.

--- Morse Code is necessary for the National Traffic System.

More and more traffic is now passed by packet radio, and much is still passed by voice. This is not to say that Morse Code is not contributing, but rather that its not the only thing around.

--- Morse Code can get through when other modes cannot.

Sometimes this is correct, but even if it were always, it does not explain why everyone has to use the mode. More can be said with voice. You can see things better with ATV. These arguments are truths, but do not apply to requiring ham to be involved with, or learn how to use, any particular mode. I could just say "one plus one equals two so therefore..." and assert anything I wanted using that kind of reasoning.

--- CW is the most efficient mode.

This is false. The very reason that CW can get through when other modes cannot is due to its high level of redundancy. It is a narrow mode, but it is also a very slow mode. Efficiency in terms of the information conveyed for a given bandwidth in a given amount of time over a given distance is not Morse Code's great strength. It does have others.

--- A CW transmitter is simple enough to build in an emergency.

How many of you even know how? Is this even likely to happen? An emergency of the extreme that requires you to build your transmitter would require little more than just sending SOS, as you are going to isolated somewhere anyway.

Message-ID: <30500399@ux1.cso.uiuc.edu>
Source record: 13545

I have scrounged the Federal Register for a word of this proceeding, and have found NOTHING.

PLEASE post the NOI or NPRM docket numbers as well as the date of issuance.

We have in the past had FALSE announcements of FCC proceedings resulting in a lot of wasted effort by well intentioned people, and a reason for the FCC to develop a bad attitude on the issues should they soon come up anyway.

> the press release managed to obfuscate that point. I thought I saw it
> buried in there, and this week's Newsline clarified it.

That's why I find it so important to read the actual NPRM in the FR.

> If you have a Communicator license and then pass a 5wpm test, you'll get
> the same privileged now accorded to Techs, but without being issued a
> Tech license. (Which, according to the proposal, would no longer be
> issued.) Instead, you'll use a special suffix with your Comm callsign.

That's a really bad idea. They should just issue it as a class endorsement
and leave it at that.

From: karn@ka9q.bellcore.com
Message-ID: <19937@bellcore.bellcore.com>
Source record: 13547

Here's a compilation of the latest element sets I have for the recent Microsat/UoSAT and Fuji launches. Since things seem to be settling down (except for the problem of getting NORAD to put the right name on each object) this will be the last set I'll post unless NORAD decides to switch objects again. Otherwise you should be able to use the sets in TS Kelso's regular posting.

944. Improve your image with a coaxial stub.

Newsgroup: rec.ham-radio
Date: 1990-02-12 14:18:13 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <12.Feb.90.14
Source record: 13549

I had a problem. My scanner began making nasty squawks. It did not need
Sherlock Holmes to identify the cause as image interference. Something
i know occurs even with handie-talkies. My solution was, coaxial stubs.
To make a coaxial stub filter you will need a T-piece for whatever
connector system you use (TNC in my case) a few plugs, and a length of coax.
Put the T-piece in the coax to your receiver, then connect another free
length of coax to the 'empty' leg of the T.
You will now have a dangly end of coax with nowhere to go.
Tune the receiver to the frequency of that nasty image you want to get rid of.
You need 1/4 wave stub resonant at the frequency of the image you want
to zap. Calculate roughly what this is (remember the effect of the
velocity-factor of the coax - somewhere between 0.66 and 0.98 depending on
type - look it up in the ARRL Handbook if need be!), add 10% length.
Listen to the image, and start clipping short lengths off of the
free end of the coax. Take off 1/4 inch at a time. Be careful. Remember not to
let the inner short to the outer. As you approach resonance the signal will get
weaker and weaker. Eventually you will go too far and the strength will
start to rise again. When this happens, make up a new length of coax to
the *correct* length (you were keeping a list of attenuation against length
werent you?) and keep the old one as a patch-cable.
Now tune to the desired reception frequency, and note that the image has
reduced. Disconnect the 1/4 wave length, and the image returns? Good - it
shows the filter is working. In practice you can get 30dB attenuation with
a single stub. Not enough? Image still there? Make up two identical stubs,
and use two T-pieces connected together by a 1/4 wave of cable. You can get
60 to 70dB attenuation that way. Still not enough? Try a third stub, or move!
Remember that the stub filters out odd harmonics of its intended frequency
too. This may cause unexpected 'holes' in reception, but you can always
disconnect the stub. If you make up a stub for removing transmitter harmonics
(yes they are great for this too) remember to insulate the end of the coax
where you have been doing the clipping, as there could be some user-hostile
voltages there.
Why not try it? You have nothing to lose except possibly a few feet of coax
and your unwanted images!

From: depolo@eniac.seas.upenn.edu
Message-ID: <20288@netnews.upenn.edu>
Source record: 13551

Has anyone else thought about this?

If somebody is interested in using CW, then they MUST learn the code in order to communicate by CW, so why bother to test code proficiency? There is no voice talking-ability test, so why have a CW test? If somebody can't talk, they obviously won't be on the phone sub bands. The same holds true for code.

I disagree with some of the other opinions that CW is worthless and is an antiquated mode of communications. It definately has its advantages over voice, particularly under less than optimal conditions. But I don't think it should be used as a shield to prevent what would be good amateurs from joining the ranks.

Just my humble opinions on this less than exciting Monday morning...

948. Packet radio license without code r

Newsgroup: rec.ham-radio
Date: 1990-02-12 16:51:49 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9002121718.AA09174@ti.com>
Source record: 13552

Matt Bartley asked about how you could recognize code tapped out with rocks or pipes.

The old telegraph code (I forgot its name) used spacing. I gather therefore that an SOS would be sent with 3 quick taps, a long space, three taps with a slightly longer space between taps than between the "S" taps, a long space, and three quick taps. An even longer space would separate the individual "SOS" groups.

By the way, some of today's Hams operating CW could use a little polishing-up in the use of spacing. Some of them run words and phrases togetherm making it in the use of spacing. Some of them run characters and words together, making it hard to copy at an otherwise comfortable speed.

Message-ID: <19900212175439.3.JOHAN@CALVIN>
Source record: 13553

We're trying to put together a demonstration on digital circuits and I
was looking for these educational systems with blocks/modules each
containing a single gate and which were wired together with spring
terminals. Heathkit used to sell them but has gone on to protoboards.
The advantage of the old style is that it is easy to visualize the
circuit for the demonstration. Does anyone know if I can still get what
I want?

>WRONG, THEY SEEM TO FIND SSB UNREADABLE UNLESS SIGS ARE "STRONG". I'M SURE
>THEY WOULD rather USE VOICE, I KNOW I WOULD.

My original intent was to address A1A vs J3E in a "normal ham environment" eg, low power HF. That much can be seen by my references to Rayleigh fading.

Most of the weak sigs work I did on 2m (back when I really was in nineland) was J3E. Auroral buzz made it difficult at times, but a trained op gets used to that sort of thing. Never underestimate the filtering capacity of the blood and guts DSP.

As for EME, well, libration fading will probably affect J3E more than A1A. However, if you have the bucks and the resources for doing EME, then you have the bucks and the resources to run Spread Spectrum. Better yet, AMTOR should do a decent job in that environment. Most importantly, however, very few people actually do EME (as opposed to the population on 20m). It makes little sense to build a defense of a general requirement on a small corner of the hobby.

>"IMHO", THESE "wonder modules" MAKE EVEN CW XMTRS EASIER TO BUILD, AND THEY
>THUS REMAIN CONSIDERABLY SIMPLER THAN ANY SSB RIG. OK, FM XMTRS CAN BE
>ABOUT AS SIMPLE AS CW, AND VERY-LOW-POWER AM W/CARRIER RIGS AREN'T SO BAD.

Oh, come on now. A nice DBM can be built very cheaply. You can always wind your own transformers. Or you can just order one from Mini Circuits.

Part of the problem is that most of the ARRL construction literature is WAY out of date. Take a look at the FM and repeaters book. Even then, the material is so oversimplified as to remove all of the relevant engineering material for someone who actually wants to BUILD something (as opposed to understanding how your typical commercial rig works).

>BY THE WAY, WHERE DO I ORDER COMPRESSION MICA TRIMMERS (LIKE ARCO 464)? I'M
>CERTAIN SOMEONE STOCKS THEM, BUT THEY AREN'T IN DIGIKEY, NEWARK, ETC. I
>NEED SOME FOR A VHF SOLID-STATE FINAL.

Try Motorola or EF Johnson. A nice letter to the Engineering group or tech support has been known to do wonders.

> Your thoughts??)

Okay folks, let's play engineer. Now, a good filter has nice steep skirts, and low insertion loss. Let's look at the CW test in that light.

On the first count (nice steep skirts, corresponding to keeping the riffraf out), CW seems to be fairly decent filter. I'll agree that there is some merit to the concept of requiring some self discipline in the entry test for the amateur service, and learning an archaic skill is certainly one way of testing for this. And, empirically, it seems to work; the jerk to nice person ratio for ham radio is rather low, certainly lower than the general population. As with any filter, there is bleedthrough, and there are some real wierdos out there. There are other means for determining self discipline that are at least as effective; separating the written exam into rules and theory, and then making the rules exam MUCH tougher comes to mind.

On the second count (insertion loss - do we throw out the good with the bad), CW is a lousy filter. It tends to keep out younger, technically oriented folk who see no reason to waste time learning the arcane skill. They have no intention of ever using the mode. And, continuing CW as a requirement only contributes to the image of a clique. The term "hazing" comes to mind.

So, CW is at best a filter with steep enough skirts, but lousy insertion loss. I would gladly support research for a better filter, and would propose splitting the written exam as per the above.

953. no-voice license

Newsgroup: rec.ham-radio
Date: 1990-02-12 20:10:46 UTC
From: oo7@ut-emx.UUCP
Message-ID: <24466@ut-emx.UUCP>
Source record: 13554

What nearly stopped me from getting a ham license was having to learn all those phonetics for ssb operation. I mean, I knew I was only going to operate CW, and yet I had to force myself to learn phonetics for all 26 letters of the alphabet, as well as some extra things I've forgotten (I think it was "QRZ the frequency", "what's the handle there", "that's a Roger contact", stuff like that).

I forced myself to do it - recited them in the car on the way to and from work, and eventually got up to speed. I bet I knew every darned one of them when I took the written tests that had questions about phonetics. Of course, I never planned to use them, and now I can't remember whether A is America, Able, Alpha or what.

I admit that it could come in handy if ever I'm buried under tons of rubble after an earthquake - instead of using morse, I could use phonetics to alert the rescuers ("Hotel Echo Lima Papa! er, er, QRZ the frequency!"). But you have to admit that voice is a pretty inefficient way of communicating these days, and it's no way to work serious DX. We should just get rid of it.

So I invite you all to join with me in petitioning the FCC for a no-voice license class. There would be a minimum cw speed limit of around 30 wpm, and we'd have to think up a pretty snazzy name for the new license class. We could have some small part of the bands set aside for those old-timers who still wanted to use voice. But we certainly won't get the young people into ham radio, they just aren't going to take the time and put in the effort to learn all those darn phonetics.

Don, I like the way you think. The international requirement to know the code to operate below 30 MHz could be met simply by ONLY allowing code operation below 30 MHz. You obviously can't operate code without knowing code!

The reason the FCC has poropsed dropping Novice/Technician is to reduce their administrative costs by reducing the number of license classes by one. We could incorporate your no-test CW privileges into the FCC's Communicator class license to satisfy FCC's $$$ worries.

I don't know about your area, but around here the cellular providers
(Bell Atlantic and Cellular One) pay a rebate to the installer for
every phone they sign up with their system. The rebate is on the order
of $300, so that $200 phone really costs more like $500.

The following comment can be taken with a :-) or not.

Today at lunch we were discussing the problems faced by the military on airfields infested (?) with birds (such as the famous "gooney birds") which make taking off dangerous (not all airplane engines were made to be used as bird-cuisinarts.) This guy was telling us stories about how they beat on pots and pans, used explosives, and all sorts of things, to no effect.

It was only after they discovered why the birds liked it there... the sand dunes gave them a good running ramp for taking off... and MOVED the dunes, that the birds moved.

Moral? Well, it seems that if you want some recalcitrant group to do what they're doing somewhere else, you put what they want elsewhere.

Is there a parallel here? Or am I suffering from severe Aesop's Syndrome? :-) anyway!

> or before the de-emphasis network/filter (if it's a cheap mono).

I've found that by tricking an ICOM R71A receiver to tune below 100 KHz and tuning in in the FM mode, SCAs can be heard by simply running a cable from the external speaker jack an an FM radio to the antenna jack on the ICOM. This has worked with 2 AM/FM portable radios and a car stereo unit which I tried. The audio fidelity isn't fantastic (probably due to the ICOM) and the reception isn't completely free of interference from the main signal. But for casual listening, it is satisfactory and doesn't require the purchase of a decoder (assuming you have a LF receiver).

Note: I wouldn't recommend connecting the speaker jack of your 100W/channel home entertainment center to your ICOM antenna jack, though. :-)

962. Re: Yaesu FT-411 mods?

Newsgroup: rec.ham-radio
Date: 1990-02-12 22:11:52 UTC
From: stan@hprpcd.HP.COM
Message-ID: <10500002@hprpcd.HP.COM>
Source record: 13558

To allow the FT-411 to recieve from 130 MHz to 174MHz and to transmit
from 140 MHz to 151 MHz, turn off the radio and hold down both of the arrow
keys and turn on the radio. Be sure to write down all of the contents of
your memories first as this will erase them ! This is the MARS modification.
Repeating this procedure will turn the FT-411 back into a HAM only transciever.
Refer to the mods server for a more involved mod that will allow you to
set the transmit and recieve frequency limits at will within the capability
of the rf deck.

WARNING: Do not transmit over the air outside of the ham bands unless you have
the appropriate MARS license! For other frequencies, don't transmit at all
because the FT-411 is not a FCC-Type-Accepted radio for the public service
bands! Also make sure that your radio can't accidently transmit on a public
service repeater (in case you are all thumbs, or your radio gets stolen!)

Here is a copy of the instructions for the mods server:

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

*** AS of Nov 1, 1989 FTP access from the internet is available
HAMSTER.business.uwo.ca [129.100.22.100]

To access a file from the archive via mail, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message MUST be -> MODS
If your mailer does not ask for the subject; make the first line of your

message look like this:

SUBJECT: MODS

The server ignores all messages that do not have MODS in the subject
field. All bad requests get re-routed to my userid ,and I eventually
read them, fix them, and re-submit them.

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

Below is an example of a file request message:

```
.................................................................
.
. Date: Friday, April 5, 1989
. From: MBRAMWEL@BUSINESS.UWO.CA (Mark Bramwell)
. Subject: MODS
. To: bitlib@uwo.ca
.
. from: mbramwel@uwo.ca
. sendme radio mods
. sendme pro2004 mods
. sendme tm721 mods
.
.................................................................
```

In the above example I have a 'from:' line in my message. That will
tell the server to send to an id other than the id listed in the
header. The userid should be reachable from bitnet. That means
UUCP users should include a gateway in their id.

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable
address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:
userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

Mark Bramwell VE3PZR
University of Western Ontario
School of Business Administration
London, Ontario

Bitnet: MBRAMWEL@UWO.CA Packet: VE3PZR @ VE3GYQ

964. ICOM 24-AT vs Joe HT

Newsgroup: rec.ham-radio
Date: 1990-02-12 23:49:25 UTC
From: pvh@Apple.COM
Message-ID: <38571@apple.Apple.COM>
Source record: 13477
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Do you who have purchased the 24-AT think it is worth the rather extravagant asking price ($629 list without tone squelch or encode/decode)? I'm thinking I should just get a Kenwood 75-A or Yaesu FT-470 since they list for less and didn't make every feature necessary for crowded repeater areas an option, even though the 24-AT has some obvious great advantages.

(any comparisons between these three units would be welcome!)

Thanks,

Pete

>marc@kg6kf.ampr.org
>
>Responding to pressure from Senator Jesse Helms and other
>right wing influences the FCC is trying to ban from the
>airwaves anything it characterizes as indecent. While refusing
...
>and eliminating previous presumptions that material not suitable
>for children could be broadcast between 10 pm and 6 am when
>children would be asleep.
>
...
>Unless you believe that the public mind should be limited to material
>suitable for children, this is a threat to your ability to receive
>anything other than pablum over the airwaves.
...

Don't get me wrong: the following comments have nothing to do with whether I think the supposed FCC action is right or wrong. However, I am offended that people believe that anything not suitable for children is indecent. There are lots of things I watch that I don't consider suitable for (particularly young) children, which do not deal with sex or even violence. Indeed, some of the things suitable for children are less "pablum" than the run-of-the-mill "Parental Discretion Advised" movies/shows on late evening TV.

Please don't equate "material suitable for children" with "pablum", and don't by implication equate "worth viewing/listening to" with "unsuitable for childern".

1. It's false.

You only need to listen on some of the HF bands and even 2 meters to
tell that it has not been a filter in the past.

2. It's not applicable.

Radio spectrum is a public resource. The purpose of the radio spectrum
is NOT to be a carrot to get people to learn an outdated communications
medium.

3. If effort is what separates the men from the boys, why not issue licenses
to anyone who can push a GM EMD SD-40 in neutral a distance of 1 meter.

> several occasions and he pretty much said it was a problem with all of my
> stuff. C'mon. ALL of my stuff is faulty? My question is, what can I do to
> get him to quit this frustrating interference?

Well, Mike, SOME of that stuff (such as the telephone) is not supposed to be receiving ANY radio signals. So a good question to ask yourself is WHY it is receiving radio signals at all. It's actually pretty easy to make a radio receiver. Simple ones are very poor and need a good strong signal. What you have is a telephone that is also acting like a poor radio receiver, and your neighbor is supplying the strong signal because he is so close.

The rest of that stuff is supposed to receive signals only on a certain frequencies (like where TV stations broadcast). If your neighbor is putting out signals on those frequencies, then it is HIS fault. If on the other hand your receivers are receiving on the ham frequencies, then it is the fault of your equipment. The sad fact is that so much of the "high tech" goodies we buy today are so extremely cheap that they often receive on dozens or even hundreds of different frequencies at the same time, no matter where they are tuned to.

Some, but not all, of the electronic equipment in my own house is easily interefered with by my own radio transmissions. I know in each of these cases that the fault is with the receiving equipment. I am lucky that I don't need to change this equipment because I live alone and do not use both at the same time. One problem I have is with my cassette deck and another is with my VCR. Both of them strangely slow down when a radio signal is transmitted. The fault is with poor (actually none at all) shielding inside these devices.

If we were to take the attitude that the fault always lies with the transmitter then the stuff in the future will just keep getting cheaper and cheaper until it receives EVERYTHING sent by EVERY transmitter, and all transmitters will have to stop (THEN you will be stuck with just cable TV).

BOTH receivers AND transmitters must share the responsibility of interference. It is the duty of the transmitter to transmit ONLY on the frequency it is assigned to. Hams are assigned a limited range of frequencies and transmission of signals outside those frequencies is illegal. It is the duty of the receiver to receive ONLY the frequency you want. If it receives signals that on on the ham radio frequencies and that is not what you want, then it is defective and needs to be repaired or replaced.

However, it is usually relatively easy to fix or adjust most equipment to make it stop receiving signals on ham radio frequencies. It is also easy to make

ham radio transmitters stop transmitting outside of the ham frequencies. Sometimes problems do develop where metallic objects can pick up radio signals and reradiate them on a different frequency. If this happens, it is really no one's fault, but the owner of it would be expected to correct the problem.

Talk to your neighbor about getting these problems fixed. He should be friendly and courteous about the problems, but don't expect him to admit guilt where he does not believe he has any. If you do not get a friendly response from him, contact us and we can find other hams in the area who can help you determine just where the problem is and how to correct it.

I am posting my email response to Mike Boyle, because I hope it can help somebody else out there, either now or in the future.

To: Mike.Boyle@f36.n376.z1.FIDONET.ORG
Subject: Re: NOISY NEIGHBOR
Newsgroups: rec.ham-radio
In-Reply-To: <257.25D689AD@uscacm.UUCP>
Organization: EE-Systems, Univ. of So. Calif., Los Angeles

In article <257.25D689AD@uscacm.UUCP> you write:
>My neighbor is a lic. HAM operator. His transmissions interfere with ALL
>electronic items in my house. His voice is on the TV, stereo, and even the
>telephone when he is transmitting. I have told him about the problem on
>several occasions and he pretty much said it was a problem with all of my
>stuff. C'mon. ALL of my stuff is faulty? My question is, what can I do to
>get him to quit this frustrating interference?
>--
>--
>Mike Boyle == ...!usceast!uscacm!36!Mike.Boyle

I would like to try to help you. Please do not take anything I have to say as a flame. I understand your situation, and I would like to help you understand how to SOLVE the problem, instead of just complaining about it.

Solutions to your problems are forthcoming. Before I give these solutions, I would like to give some explanation as to why the problem exists in the first place.

First, the question you should ask is not "What can I do to get him to quit this frustrating interference?", but "How can I reduce or eliminate this interference problem?".

There two things to consider here. There is a SOURCE of the interference, and there is a CAUSE of the interference. The two are not usually related. Undoubtably, your neighbour is the SOURCE. The CAUSE, however, is most likely poorly (cheaply) designed consumer electronics equipment.

Studies have shown the manufacturers of consumer electronics that an incredibly small percentage of consumers will ever live close enough to amateur radio operators (or high powered transmitters on other services) that good filtering will be required. Consequently, the manufacturers don't put the filtering in. Saving a few cents on hundreds of millions of units means tens of millions of dollars extra profits!

There are two ways that you can use to solve your interference problem. You can try to force your neighbour to cease operating, or you can correct the deficiencies of your equipment. I recommend the latter, for two reasons: (1) Your neighbour has a legal right to operate, as long as his equipment meets federal standards regarding transmitters (and it is highly likely that his transmitters meet these specs). It is going to be incredibly difficult to legally force your neighbour to cease operating, and it may be impossible if his equipment is functioning properly. (2) The solution you should seek should be one in which all parties involved are satisfied. Your neighbour will not be satisfied if he is forced to cease operations.

If your approach is the second listed above, then you will probably be able to get your neighbour to help you solve your problem. He probably knows something about solving interference problems, and he surely has many friends that he can talk to on the air that can help you. He can help you by providing a signal as you are trying to fix your equipment. It is much easier to solve interference problems if the interference is there when you are working on it. If I was your neighbour, I would be most happy to try to help you. Your neighbour is not under any legal obligation to help you, either technically or financially, but I think that he will try to be as helpful as possible.

SOLUTIONS:

Telephone:

Lets start here, because this one is easy. First, it should be obvious that when a telephone starts activing like a shortwave receiver, there is something wrong with the telephone. Fortunately this problem is easy to correct. The problem exists because the radio signal is getting into the telephone and getting detected just like a signal gets detected in a crystal radio (like you might have built when you were a boy). The signal is being detected in a crystal diode. The solution is to prevent the radio signal from reaching the diodes in the phone. The radio signal is coming in on the phone line. The phone line is only supposed to carry audio signals, but since it is close to your neighbour's antennas, your phone line is acting like an antenna. In order to prevent the signal from getting into the phone, get some 0.01 uF capacitors, and possibly some ~100 uH coils. These are available at Radio Shack; Radio Shack also has Snap-Together Toroidal Choke Cores. These can be used to make a coil by winding the phone like around the choke core. Place the inductors in series with the phone line, and place the capacitors across the phone line, on both sides of the two inductors. In addition, it often helps to take your handset apart, and place capacitors across the microphone and speaker.

Stereo:

The answer here has to be multi faceted, because your stereo is comprised of many components. The first thing you must do is find out how the signal is getting into the stereo. The most common, is that the speaker wires act like antennas, and the signal comes in to the final

audio amplifier stage. It gets detected in the transistors (a transistor is just two diodes) and then amplified. To check for this condition, put your stereo on a CD or AUX input, and turn on the amplifier. You might want to turn off your CD player, and/or disconnect it. If the interference is coming in on the speaker wires, it will still be there, and the volume control won't have any effect on it. In this case, put a capacitor across the wires at both ends, both at the amp and at the speaker. Also put a capacitor from each speaker terminal to ground at the amplifier. (This is sometimes only required on the "hot" speaker wire.) In addition, you may want to put inductors in series with both of the speaker wires. If this simple solution doesn't work, then you might construct a filter, like this:

```
-----+----- coil -----+----- coil -----+-----
| | |
amp cap cap cap spkr
| | |
-----+----- coil -----+----- coil -----+-----
```

additional stages can be added as required. Usually 3 or 4 stages will solve the problem. If the problem is particularly bad, and isn't solved with this type of multistage filter, then there is still something you can try. Get an old TV, and remove the yoke from the back of the picture tube. At the back of the picture tube you will find some very large coils. Inside these coils will be two large ferrite cores, similar to those sold by radio shack, but much larger. You can get at these by using a wire cutter to cut the coils of wire off of them. Be very careful with these ferrite coils, because they are very fragile and brittle, and they break very easily. Take these ferrite cores, and wrap the speaker wires around them. You will have to experiment to find out just how many turns you need to wrap. This solution has ALWAYS worked for me, even in situations where the stereo and speakers were less than 30 feet away from the antenna! (You might also find that these ferrite cores work well for wrapping a phone line around also.)

The signal could be coming into your stereo by other means, but this is highly unlikely. Here are some quick notes; please contact me if this is actually the case, and I can provide some more information. For your turntable, place capacitors across the wires on the cartrige, right on the tone arm. For your tape deck, place capacitors across the receiving tape head. For your FM reciever, use a high pass filter on the antenna terminals. These high pass filters are the same high pass filters for televisions, and are available at radio shack. In general, you want to use 100% shielded cable for all audio connections. 100% shielded cable is available at radio shack. You can buy the cable, and put the RCA audio connectors on yourself if you can't find it already assembled. Only try the 100% shielded cable if other things fail, as most cable is around 90%+ shielded, and is usually good enough.

It is not usual, but the signal could be coming in on the power cords. To test for this: unplug everything from the amplifier (even the speaker

wires), and listen on headphones with a very short cord. If the interference is the same as when the speaker wires were on, then the signal is possibly coming in on the power cord. If the interference is different at all, it is probably NOT coming in on the power cord. Note that it is also common for the signal to come in on the headphone cable, but the interference level will be different because of the different length and placement of the headphone cable as compared to the speaker cable. Note that if the interference is coming in on the power cord then the volume control will have great effect on the interference. With the volume control all the way down, there will be NO interference!

TV

The first thing to try is a TV high-pass filter. Put this filter in series with the antenna cable. These filters are available at radio shack. The signal could also be coming in on the power line. To solve this problem, get some ferrite cores from the yoke of an old TV, and wrap the power line around it just like the speaker wires or stereo components power cords. Cable TV is usually a great solution for getting rid of interference problems, because the signal on the cable is usually very strong.

VCR

You didn't mention a VCR in your posting, but I thought I would mention it because it is such a wide-spread problem. The problem is particularly bad, because the circuits in the VCR must be designed for wide bandwidth to provide a good quality video signal. Video signals have very wide bandwidth. The trick here is once again to prevent the radio signal from getting into the VCR. There are no easy solutions, but the best that I have found is to build a faraday cage for your VCR. Get some lumber, and some ordinary window screen. Build a completely enclosed box to put your VCR in. The box should have a door so you can have access to your VCR's buttons and tape entry/exit point. All sides of the box should have the screen on them, and each side should be electrically well connected to each other side. The door should be electrically well connected to at least one side, and all 4 sides if possible. Make sure that you electrically connect the shield side of the video cables to the faraday cage with a SHORT cable. Mount connectors right on the faraday shield if you can. You definitely want to use one of those ferrite cores from an old TV on the VCR's power cord to prevent the signal from getting into the VCR that way. This solution, while it looks ugly, has worked exceptionally well for me.

I have spent a lot of time on this letter, and I hope that these solutions will help you with your problem. If I can be of further assistance, then please contact me by email.

Message-ID: <9002130348.AA14607@DELPHI.MIT.EDU>
Source record: 13568

To modify the 200XLT for recieve of cellular service:

1. Remove antenna and battery.
2. Remove two Phillips screws from back, two more from bottom (battery retaining spring screws, and the spring itself.
3. Pry rear cover off from bottom and remove.
4. Revove two small screws from base of circuit board.
5. Pull front panel from mainframe at base and separate.
6. Find IC labelled UNIDEN UC-1447 and 10k ohm resistor (brown-black-orange) above it.
7. Cut 10k resistor in two with small wire cutters.
8. Reassemble, make sure dual-inline connector at bottom of board lines up correctly with socket. Gently tighten bottom screws.
9. Replace battery retaining spring (slotted side toward notched hole), insert screws and tighten them securely.
10. Replace battery and antenna.

This should allow entering of cellular freqs. Given to me by friend who said it works, but no warranty from me.

Actually, it can be VERY EASY for that RF to come into the power cable. I've
been having fights with my parents and my sister when I'm home because my 10M
(and before, my CB) came over the stereo and phone (since we use cable, we've
seen no effects with any of the TV's). Strangely enough, the only radio it
effects in the whole house is my sister's stereo, especially when it is on
the tape player and she's recording-it does not affect any of the numerous
clock-radios we have.
My parents forced me to only use the radio certain times, even though I
easily came up with a solution (I'm the only ham in the whole family; therefore
no one really trusts me or understands me).
I simply choked the s**t out of the entrance of the phones (each phone) and
the power cable of my sister's stereo. I didn't have to do anything to the
speaker (I don't have enough power, only 25 watts, but it could be something
else).
I also believe I (at least partially) found the cause for all the RFI.
When I had my CB, the interference was there, but much less. The antenna
(a 1/2 wave Shakesphere stick sold by the Rat Shack) was also tuned for CB.
I'm still using that antenna-untrimmed and on 10M with an el cheapo CB antenna
tuner (I say that because it uses mica compression trimmers for the 2 legs
of the pi (yes, pi) network and a fixed inductor). It works great. But
my other problems are:
1. I'm using old Rat Shack RG-8 coax, and the shielding is the pits. I know
this for a fact because I can hear every single thing that generates
square wave RFI (i.e., my TNC and computers) in that radio!
2. The antenna is still cut for the middle of 11M (27.125 MHz). Therefore,
it WILL generate currents on the outside of the coax, as it has no radials
(remember what these things look like? The coax goes up the middle of the
bottom half of the antenna and connects the shield to the bottom and the
center to the top 1/4 wave section to form a vertical 1/2 wave dipole).
I wish I could cut it, but it's fiberglass, and the construction of the
bottom won't let me. I'm thinking of getting a 10M version and selling
this one.
3. The coax runs parallel to LOTS of house wiring, both power and phone!
About 35-40 FEET of run (approx. from one end of the house to the other
thru the attic). And with those outside currents and leakage, well...

Now don't get me wrong. This system works great, and I've worked plenty of
DX with it. And that doesn't mean that your neighbor has these problems: This
example is the exception, not the rule. And it only affects my house as well,
primarily.
One tip with the capacitors, not mentioned before: Make sure they can
withstand at least around 60-70 volts on the phone line. Each time the phone
rings, it will send that kind of voltage through the line, and you will blow
the cap if it is less than this value. The same goes for power lines, should

you choose to ever put some across: Make sure they are rated for at least 200 volts! While the wiring says 120, the peak voltage on it many times is ~185 volts. A good alternative (IMHO) if you want to get fancy, is to install some heavy duty (the bigger, the better) MOV's in that power line. You'll get capacitor workings (look at them, they look like a disk ceramic cap, and have about the same capacity, too) AND SURGE SUPRESSION! I'm not sure if you can get them for phone lines. Rat Shack has MOV's for 120 volt power lines. Well, better get off the soap box for now. 73's, Mike, N7MSD

975. New-car QRM - radio fights back!

Newsgroup: rec.ham-radio
Date: 1990-02-13 11:18:21 UTC
From: PJML@IBMA.NERC-WALLINGFORD.AC.UK
Message-ID: <13.Feb.90.11
Source record: 13569

New-car QRM is a reciprocal problem. I can stall the engine of my father's Volvo by keying up a 60-watt 2meter FM transmitter in my car parked next to his. The engine management ECU is clearly vulnerable to RF.
I can show this by keying a handheld next to the ECU. The engine stalls. When on the move, keying a transmitter causes the engine to hesitate. The local dealer professed complete ignorance of any problems, and was surprised when we demonstrated it. He has written to the makers (in Sweden) for advice on curing it. There are also bursts of horrible S9++ noise (carrier modulated with a raspy, fluctuating tone) every 120KHz or so across the 2meter band.

Well, we have both camps here at IU. I am currently the President of the
Indiana U Amateur Radio Club. Simply put, our members don't have the time
or motivation (myself at the top of this list) to get over to the station
and turn everything on just to talk to people. Sure, when there's good DX
you'll find a few people over there, but most of us are just plain too
busy with other things (some study, some chasing women, some sleep) to commit
a lot of time to K9IU.

Concerning the No-code/code forever debate let me toss in my opinion:
1- Code keeps the riff-raff out like a wet paper towel.
2- Look at the freq. 14.313,3.913,3.898,and other spots on the SSB dial.
Here we have the 145.25 which is inhabited by CBers,drunks,idiots,lids and
bootleggers. There are a *few* hams there (unless you include the control
op then theres several hams there) so Code is not a filter but a barrier
to those who don't care about the HF bands. I like code and would like it
to stay around but I don't like it to be a requirement. Frankly, I wouldn't
want to be tested on Packet or SSB if I wanted to work FM or CW. So
Why test for Code? Test for tech is a must since we *can* work on
our own stuff. (CBers can't if I'm not mitasken) Let no-code become
a reality and Let's get back into tech!

> than the Technician has, the argument is clearly false.

This is only true to the extent that such proposals are actually implemented.
I did not get much of a sense that this will happen from reading the FCC
proposal. I have no objection to code free. However, if technical competence
is the objective, it should examined for honestly.

> 5 WPM is not a barrier for anyone seriously interested in ham radio.
> Neither is a written exam on the technical characteristics of packet
> radio, but we would not expect to force everyone to learn these things
> even though most hams could if they just put their mind to it.

Are you arguing for a theory free class of license? Perhaps we should have
exams that are only rules and regs and CW. The idea is not without merit if
it could serve some useful end such as getting more people involved in public
service.

College clubs are still alive and well!

I am a former president of W2SZ (The RPI (Rensselaer) ARC) and am happy
to report that our club is doing very well right now. I have seen interest
waver over the past three years, but right now, we have a great group of
students, alumni, and community members involved in the club.

There's certainly time enough for radio in college, if you make the time.
Our club is pretty active in many facets of the hobby and we find that
amateur radio is a great avenue for tinkering, experimenting, and relaxing.
Yeah, the ugly girls and the beer are still around, but amateur radio still
has its place among college hams. We find enough time to study, put up
antennas, fix radios, operate VHF/UHF contests, and still gawk at ugly
girls and drink beer.

Sure there are still a bunch of hams on campus that don't get involved,
although I can never understand why, but there are enough of us active to
keep the club going strong. By the way, some of the oldest ARC's are collge
ARC's. For example, W2SZ (previously just 2SZ) has been around since about
1921!! Paging through some of the old logs revealed such breakthroughs as
the club's first 28 Mhz contact.. Neat.. And that was when *everything* was
homebrew.

> NOT mean its time to just give up on ham radio. Use a club station.
>
> --Phil Howard, KA9WGN--
> <phil@ux1.cso.uiuc.edu>

Phil, it's true that dorm rooms don't offer much opportunity to indulge amateur radio, but it can be done. In 1972, I lived in Garner Hall on the University of Illinois campus (you ought to recognize the dorm to which I'm referring). I was then WA9SQY, and my friend Gary (now NJ9Z, formerly WB9H??) lived down the hall from me. He and I were both on the top (4th) floor, but his room faced the outside of the (metal-sided) building, while mine faced the courtyard. We both had our rigs on campus--mine a Heath HW-100, his a Drake R4/T4 combo--and we hung a 40/15-meter dipole from his window and tied the ends to some trees conveniently placed on the north side of the building. We then ran a length of RG-58U out through the ventilation slots in the transom above his doorway and suspended it from the ceiling tiles in the hallway; it entered above my door. We also wired a couple of junk-box relays in a bistable configuration and connected the relays to the auxiliary switch contacts of our rigs. If Gary would power up his rig while the antenna was unused, it would connect to his equipment and would prevent me from taking the antenna. Conversely, if I were to power up my rig, the antenna would connect to my equipment if it were not already in use; Gary would be prevented from taking the antenna until I relinquished it. Given that I was in engineering and he was majoring in art and thus had much different homework habits, there was never any instance of us having an antenna contention problem. Looking over the old logs, I see that I worked Argentina and Germany on 15CW from there; CW had the advantage of producing less trouble with the ubiquitous dorm stereo systems than SSB, though I do see some SSB contacts logged.

The best part of the story, though, was the response of the dorm maintenance personnel; they asked, with a great deal of suspicion, "what is that black wire for?" And I told them that it was for "High-power, high-frequency ionospheric electromagnetic-wave propagation phenomena research," and, dropping my voice to a confidential whisper, "there's enough power in that cable to burn your fingers if you try to cut it." They left it strictly alone, and Gary and I were left in peace to pound brass from our rooms.

By the way, Gary and I had heard nothing from each other since graduation until two years ago, when he called me out of the blue. Turns out we were within repeater range of each other! We've been keeping skeds since, and one of our first shared memories was the story of the dipole hung from his dorm window.

The "old telegraph code" is called Morse Code. Hardly anyone uses it any
more. Nowadays, amateur radio operators use a code called "International
Morse Code". The two codes are quite different. For example the letter C
in International Morse is '_._.' while in Morse Code it is '.. .'. Yes
spaces INSIDE letters. The FCC allows Morse Code to be used by Amateur
Radio Operators, but only for domestic contacts. Seems odd that so many
people on this net are so vocal in wanting to retain a requirement for
a code that is restricted to domestic contacts.

```
This is the CALL FOR VOTES for the creation of a new newsgroup
to provide a forum for the discussion of noncommercial radio
among broadcasters and listeners.

Vote by replying to this article. Votes must be clearly stated
as for or against rec.radio.noncomm as described in this article.

Votes will be accepted until March 13, 1990.

NAME: rec.radio.noncomm
CHARTER: unmoderated discussion of noncommercial radio.
Some topics to discuss are:
- listener opinion
- noncommercial AM/FM radio of the college, community, and NPR variety
- carrier current and cable based radio
- do trade journals manipulate or aid?
- upcoming conventions such as the Nat'l Assoc. of Broadcasters/BEA
meeting in Atlanta and the Intercollegiate Broadcasters Society in NY
- the newly released "Public Radio in the 1990s" report by The Public
Radio Expansion Task Force
- the FCC and its regulations
- obtaining and managing non-commercial grants
- programming sources

First, a word about power line bypass capacitors. 200 V capacitors are NOT adequate, and failure could be a safety hazard, since most audio equipment is not grounded. (Large transients appear on all power lines.) For 120 V lines, capacitors rated 1.4 kV are usually used. Even the standard 1 kV capacitors are marginal.

For the ham who lives in an urban area, audio interference can be a real challenge. Many neighbors may be affected, and few will understand that it is not the amateur's fault. Even though the problem can always be fixed at the receiveing end, it can involve quite a lot of work. In addition, some of the remedies can adversely affect the performance of the audio equipment. An amateur, no matter how friendly and well-intentioned, cannot be expected to perform the necessary modifications to a dozen or more neighbors' equipment. In addition, some of those neighbors may not be too receptive to the idea of someone messing around with their expensive stereo systems. Obviously, the ultimate solution is to require that all electronic equipment be properly shielded and filtered. This is not likely, however, since it would increase the cost of all such equipment, and benefit only an insignificant proportion of consumers. We amateurs ourselves, unfortunately, are part of that insignificant proportion.

I'd be interested in hearing about the approaches taken by other hams in dealing with the problem.

Hi

Just a quick note of trivia. I have a friend who was shot down
in VIET NAM. While in a P.O.W. camp he communicated with other pow's
using Morse on the walls between the cells. They used sticks or other
objects to tap out the dots and would drag the stick across the wall
to form the dashes. He said that this was his only contact while a
POW and it kept him from going crazy.

This method could be used by your earthquake victims mentioned
in the previous message.

Hope that this was of some interest to you.

TGOB
CLARK HARTNESS, WD5GDA

ps. Code is a barrier only to the Handicapped and those who think they are!!!

My opinion is mine and no one elses.

Well, if you helped encourage more interest in the ham radio group, then you could ALSO socialize with the ham radio group.

Get women into ham radio, and you guys can chase them there, although chasing them by radio might be construed as "business" :-) We definitely need more YL's in the fold.

Once hams on campus are socializing, you even meet together in various public drinking establishments and guzzle some of the brew with the other hams.

You don't have to be in the station and operating every minute of being part of the ham radio group. Just socializing with the others is enough, as long as there are enough of them (and you are one of "them" to the others, so be there, and what about the YL's chasing the guys?).

^^^^^^^^^^^^^^^^^^^^^^^^

Just a quick reminder, operation of this type is illegal. An FCC
TYPE ACCEPTED radio is necessary for operation there. You are
endangering your commercial and amateur licenses. As I remember
all the FCC has to do is prove that the equipment on hand can be
operated out of band and they have a case. I could be wrong here.
If I am I am sure someone will correct me.

I have a TM-631 that can be modified for TX out of band. I choose
not to mod it to do so because I an sure some day my fat fingers
will hit the "band" switch on the mike, and switch 154.325 (local fire freq)
into the main band JUST as I give my call sign. OOPS ! As a matter as fact I
already have done it but the radio just gives me a boop and does not TX there.

Give it a lot of thought before using ham gear in the business band!
The FCC is not stupid (contrary to popular belief) and will only
take so much abuse before they start a crack down on manufacturers
and operators.

There are also some other PC based boards available. The Watson Board
from Natural microsystems is one (I actually bought one at a ham-fest).
This one has a 1200 (other configs have 2400 etc) modem, touch tone
decode and voice record playback capaility. You got the memory/disk space
it uses it. I think they're priced at the $199.00 to start. Software
is included including drivers for different programming languages. This
woul make on great repeater controller with expandability, another
radio another board...

Dialogic Corp also make PC based boards. I have one of they're old ones.
It doesnot have a phone interface, but a speaker/mike interface. I don't
have a line on thier newer stuff, but it works basically the same as the
above mentioned board.

There is also GW instruements which has MAC based stuff (but it's more $).
\
Hope this is useful info....

For those of you who have never seen a "halo" on top of a building
with lighting rods during an electrical storm, there is a thing
called ground shift.
There was a building that belonged to one of the Bell operating
companies that was built with lightning rods on the building. However
the land it was built on was not taken into account (it's make up).
From my understanding (given to me by the expert consultant we hired)
the ground was nonhomgenous (electrically due to a difference in earth
compounds) which in turn created a non uniform ground pottential.
In short the ground rod in the northwest corner of the building was
NOT at the same ground potential as the grounding rod at the southeast
corner of the building. Normally this was not a problem, however the
the lighting rod installation included a binding (at the roof) of all
the lighting rods by a braided cable. Now if I only kept a copy of the
pictures we had of the lighting "halo" that ocurred.

This kind of makes me wonder wether a single "earth" ground with
all my wires going to it is better than multiple "earth" grounds
with some of my wires going to it (but not shared)?

>be granted an EXTRA is old-age thinking.
>...

This debate is stupid. It's religious. Neither side will listen to the
other's sensible reasons. Why do we have to put up with it annually?

Erik, you have a lot of good reasons for supporting your "no code" view.
So why resort to calling CW "old". Sure it's old, but you have plenty
more logical reasons for doing away with it than that.

I have had fundamental overload problems with my neighbors TV
and my own for years. We (he is understanding) have tried many
things. He even bought a new TV (Sony) thinking it would cure
it but it did not!

So - finally a solution. An ad in one of the ham magazines caught
my eye. It is TCE Labs 5818 Sun Ridge San Antonio, TX 78247.
Phone 1-800-KILL-TVI. Ask for the BX cable TV filter for $24.95
including shipping. It is a high pass filter which also apparently
breaks up currents on the coax. Again I have tried other solutions
which were supposed to do this (like two 75-300 ohm baluns back to
back) but they did not work for me. This TCE unit absolutely
eliminated the interference. They will ship before they receive
payment and promise your money back if it doesn't work.

I have absolutely no connection with this company but after my
years of trouble I thought you all would like to know.

I sure can relate to 'no time now for radios.' The schedule I am running in school precludes getting up to the Ohio State ARC (station W8LT) more than once a week. And this is usually the day we have club meetings! I tend to make up for it by operating a lot during the summer, though. As for chasing women: I've been married for 3.5 years.

Ham plates in Ohio cost an extra $5.00 a year. Its really a cheap vanity plate. I have one and like it.

re: dashless morse:

Is there some OT railroader on the net who can give us the real poop on
how it was really done? I had the impression that the morse "sounders"
actually created TWO clicks for each dash or dot. Another folklore I have
heard had the downwards click sounding different from the upwards click.
So that it is more like a "click-clack" for a dot and a "click.....clack"
for a dash. None of the 800 c/s tone the wimpy youngsters use. :-)

re: Communicator class license:

I am another one who supports opening up the CW portions of the HF bands to
the "Communicator" class licensees. Certainly, no riff-raff would be demented
enough to pound brass when s/he could be shouting into a microphone, now,
would they?? As for excluding bad fists, they don't even test you on
sending CW anymore for any of the Amateur license tests given by the VECs.

This would allow the newly admitted members of the Amateur community to
experiment with HF propagation and the like. Surely, lack of CW proficiency
is no indication of lack of ingenuity, is it? You don't *have* to answer
their CQs if they send at 2 WPM, afterall. No, this is not a case of sour
grapes, either; I have authorization to sign /AE. So, even a person who has
worked his tail off *recently* to get his CW speed up is capable of welcoming
people who have no incentive to learn yet another coding scheme.

998. Alternative proposal on No-Code

Newsgroup: rec.ham-radio
Date: 1990-02-13 21:55:50 UTC
From: sorgatz@ttidca.TTI.COM
Message-ID: <9920@ttidca.TTI.COM>
Source record: 13490

(as a preface:)
In article <30500400@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu writes:
+ (in response to this)
+> If you have a Communicator license and then pass a 5wpm test, you'll get
+> the same privileged now accorded to Techs, but without being issued a
+> Tech license. (Which, according to the proposal, would no longer be
+> issued.) Instead, you'll use a special suffix with your Comm callsign.
+
+That's a really bad idea. They should just issue it as a class endorsement
+and leave it at that.
+
+--Phil Howard, KA9WGN--
+<phil@ux1.cso.uiuc.edu>

Yes, it's a horrible idea. So here's a (IMHO) better alternative:

Communicator Class - 10 meters and up, 200PEP and all that jazz.
No CW only a 60 question technical theory and
Radio Law exam. Callsigns to be new Group E!
This will settle the issue of who's-who!(Format== WC6XXXX; XXXX==ABCD, etc.)

[Novice ops to be grandfathered all privs of Communicator plus their
CW on the lower-HF bands with no limit on renewals. Upgrades to General
require a 70% passing score on Element 3a & 3b.

Tech ops that passed the full Element 3, or Ele 3a &3b are grandfathered
General Class status.]

General Class - Element 1b (13 WPM cw) will no longer be required. Only the
5 WPM test of Element 1a. will apply.

Advanced Class - NO CHANGES.

Extra Class - Element 1c (20 WPM cw) will no longer be required. Only the
5 WPM test of Element 1a. will apply.

There, now we have only 4 different licenses, all beyond Communicator must
satisify the ITU agreement with 5 WPM, and the only people who are gonna
scream bloody murder are those that have already passed the 13 or 20 WPM
code tests! To these folks I would ask the following:

1) Have you delved into RTTY? SSTV? ATV? AMTOR? ASCII? PACKET? OR OSCAR?
- well I have! A lousy TECH! I've done every mode but DSP and SS and
those are next on my list. (Are you as involved?="?")

2) Are you a member of ARRL? AMRAD? AMSAT? A local ARC? A net?
- I'm into all of the above ("?")

3) Have you built an HF linear? a TNC? your own computers? A rig? an antenna tuner or beam antenna? An audio processor unit? A vox for an oldtime tube rig that didn't have one? A DDS that works with common 5-7MHz VFO rigs?
- I've done these things, and enjoyed the thrill of homebrewing no-end! ("?")

4) Have you ever done any serious repair work on any modern (post 1970) gear? Changed an IC? Any surface mount components? Found a bad EEROM-EPROM-ROM? Fixed an HT? Changed out a ROM version of a micro for an EPROM version and then written your own code for new features? ("?")

5) Ever taught a Novice class? Elmered A n y o n e?? E V E R ??
-I can claim 12 exellent additions to our ranks, 5 of whom are now Techs and struggling with the 13wpm...4 of these have already passed Element 4a! ("?")

S C O R I N G:

A) If you answered no to any one of these 5 questions, don't bother talking to me about the "need" for CW skills beyond 5 wpm, it's just bullshit and you'd only make yourself look like an ass. Amateur Radio is about technology and the Art of Radio Science. Which has about as much to do with "blazing-brass" as being able to play drums..yeah, they're both communications skills but neither has much to offer you when you need your rig fixed!

B) If you can honestly claim to have answered yes to all 5..and you insist that 13 WPM cw skills will make me a better Amateur..you'd better be able to quantify that in 200 words or less so that we can all understand it and agree on it. You'll earn the respect of everyone in the Amateur Service and I'll buy you a drink of choice and toast to your wisdom and long life!

C) If you answered no to 3 or more of the above you are a LID and should be calling 976 numbers instead of wasting 3-5KHz of 75 meters to complain about your latest aches and pains! ;-)

Think about it...'73!

Something we used to do (maybe they still do) at Syracuse Univ ham club station was to offer to send Valentine's Day greetings via ham radio traffic. We set up a table and staffed it with some reasonably normal looking people :-) and took down messages and addresses.
This gets remembered at the time for getting funds for new equipment, etc, from the student activity council, student government, or whatever it's called.
I realize that it's too late this year, should have posted this earlier! hope this helps next year. 73 de WA2ISE

A single ground is best, assuming it has low enough resistance. I doubt the halo was due to the multiple grounds. The difference in potential between different ground rods is small, except during a lightning strike. If, for example, your antenna were grounded to one ground rod, and your transmitter to another, a lightning strike could cause a very large current to flow through the feedline and transmitter. Even a nearby strike might cause enough difference in potential between the two ground points to cause a hazardous situation.

The policy for ham call plates varies by state. Here in Colorado, we pay $2.00 over the usual license fees for amateur call plates, which is much less than the "vanity" plate charge.

> Kirk: "Spock! Where's that power you promised?"
> Spock: "One damn minute, Admiral." -- Star Trek IV : The Voyage Home

The reason I included even his .signature in my reply will follow...

Matt, as a Star Trek fan, think about the scene in ST V (the newest movie).

Kirk, Spock, and McCoy, are locked in the "brig". Scotty, "Taps" them
instructions in morse, that are perfectly readable.

This code is sent much less than 5 words per minute. So it proves that
13 wpm and above is not necessary. :-) SMILEY

Seriously, though it is time that the CW folks realize that CW is no longer
necessary for operations unless it is CW operations. The international
regulations don't require 13 wpm or above. CW proficiency has no bearing on
voice, packet, atv, fax, rtty, etc...

Re: Ham license plates

Why? So hams can recognize each other. Or so you can brag. Or so
civil authorities have a chance at identifying supplemental assisting
vehicles in emergencies.

Or so you know who to beep 'HI' to on the horn. (Which will cause the
no-code folks to wave the finger at you for the misinterpreted insult.)

In high crime areas, call-plates invite theft of your radio.

It is also a recognition by some state legislators in some states that
hams help in emergencies and therefore deserve a little token recognition.

I have 'em on my jeep.

The club station at Mississippi State University, W5YD, is alive and well! It does suffer from the same problem as the other college clubs... almost all the members are engineering students and it tough to fit it in the schedule. However it has just started a novice program that had 29 people sign-up.

I've had some great times at the station... without even turning on the radios.

Also have done lots of DX, talked to my grandfather, father and brother (all hams scattered over the south), worked contests and just generally had a blast.

I'm out of college now (Thank God!!!) but still go to meetings and try to help out. It has been worth it.

I think the maximum voltage on a phone line ringer is 115. The farther you are (topographically) from the local hub, the less the voltage. I believe the dial tone runs at 40v. Therefore, capacitor breakdowns should be based on the 115 volts. Or, put a VOM across you phone lines and have your neighbor call! You'll read RMS too.

Bob, N5GNA

P.S. I test airplanes, not phones.

>I would like to test a satellite-tracking program
>on a geo-stationary (or is it geo-synchronous?) orbital

>already included in Kelso's weekly data postings,
>you could just tell me the name of the satlllite so I'll

There are LOTS of geosynch satellites in Kelso's recent postings.
Examples include GOES 2,3,4,5,6, TDRS 1,2,3, Gorizont 19, Raduga 24,
1989-101A, JCSAT, 1990-002B. To find these, i used InstantTrack. It
keeps all the satellites Kelso distributes in its database at once.
I just popped up the satellite elements screen, and held down the
right arrow key. This flipped me thru the satellites like flipping
rapidly thru the pages of a book. I just watched for satellites with
a period on the order of 1436 minutes. Equivalently, you could just
look at one of Kelso's files, and look for satellites with a mean
motion on the order of 1.0027 . Then to be geoSTATIONARY, you would
also need a very low inclination (theoretically zero, but typically
might be 1 degree or so), and an eccentricity very near zero.
A side note: The NASA/NORAD element sets for geostationary satellites,
as distributed by Kelso, don't look very stationary. I haven't looked
closely, but i suspect that the elements they compute are just noisy.

| > Your thoughts??)
|
| On the first count (nice steep skirts, corresponding to keeping the riffraf
| out), CW seems to be fairly decent filter. I'll agree that there is some
| merit to the concept of requiring some self discipline in the entry test
| for the amateur service, and learning an archaic skill is certainly one
| way of testing for this. And, empirically, it seems to work; the jerk to
| nice person ratio for ham radio is rather low, certainly lower than the
| general population. As with any filter, there is bleedthrough, and there
+---------------
```

I'd say so. I heard an AM ham on 3985 a week or so ago (sorry, I missed the ID)---a few minutes after I tuned him, he was stomped on by an SSB'er and ended up in what sounded like an argument of sorts about who got to use the frequency. (One-sided, from my perspective: the ICF-7700 doesn't do SSB, and I haven't upgraded to the 2010 yet; the AM'er was polite, I don't know what the SSB'er was saying.)

At 3.985 MHz, I doubt that either was a pirate using a modified CB rig.

```
+---------------
| are some real wierdos out there. There are other means for determining
| self discipline that are at least as effective; separating the written
| exam into rules and theory, and then making the rules exam MUCH tougher
| comes to mind.
+---------------
```

Sounds good to me.

```
+---------------
| They have no intention of ever using the mode. And, continuing CW as
| a requirement only contributes to the image of a clique. The term
| "hazing" comes to mind.
+---------------
```

I thought of that as well; although CW *does* have merit, so you can't really call it "hazing". I currently perceive it being pushed as a sort of "badge of honor".

|
| IMHO, you are correct EXCEPT for a license class that WOULD (since no such
| class exists) granted MORE code privileges ONLY.
|
| Having to pass 20 WPM code to get more VOICE or RTTY privileges is stupid.
+---------------

Dumb question: what about redesigning the license system to use technical levels *and* skills? The current structure could be retained and then each class would have sub-classes for voice, RTTY/packet, CW, etc. One could hold multiple sub-classes at the same time; I suspect voice privileges would be granted automatically. I note that the FCC proposal already contains a hint of this in the proposal that Communicator class plus 5 WPM CW would grant Technician privileges.

The rules-and-theory test would be supplemented by tests relevant to the mode of operation; one would start out with the voice license, then take a Morse code test for CW operation, etc. (I don't know what would be relevant to packet or RTTY, since I'm not very familiar with them.)

Just a random idea from an aspirant....

As an officer of the UCLA Amateur Radio Club, I can also testify as
to low club station useage. In a way, it's almost a Catch-22:
in order to attract hordes of avid new members, we need to hold
their interest through activities. To have those activities, we
need member participation. We have tried scheduling events with
few committed members in hope of attracting more, but it doesn't
seem to help a whole lot.
I think one of the factors influencing non-participation is
the fact that most of the active members tend to be engineering
students, who are generally quite busy with classwork. On those
rare occasions when we have breaks from the workload, ham radio
tends to loose out to the wilder life... Maybe if we installed
a wet bar in the operating room? :-)

> (For example - Why would the FCC allow a communicator-class liscensee
> who has not passed a code exam opperate HF CW? Beats me!)

Probably because someone made this up!

I've heard a number of different reports about what the proposal actually is, and there are in fact some conflicts in these reports. But none of them so far has said that the FCC suggests giving HF privileges to someone who has not passed a Morse Code exam.

I am waiting for the ACTUAL PROPOSAL to appear in the Federal Register. That way I will know I have the real thing, correct and complete.

Sometimes I am amazed at the degree to which people AVOID "getting it right". I researched the matter that has been posted here concerning the FCC's issue on a 24 hour ban of adult programming for braodcast, and have found it to also be far from correct. I am preparing a summary of the actual facts in that matter for later posting (and yes, I finally found out what is REALLY going on with that).

> --
> --
> Mike Boyle == ...!usceast!uscacm!36!Mike.Boyle

I can sympathize. Some of my neighbors have the same problem with me. The basic problem is that the manufacturers of consumer electronics equipment build the stuff with NO fundamental design toward supressing interference from radio transmitters. The FCC tried to address this problem a few years ago by requiring manufacturers of VCRs, phones, stereos, TVs, etc to meet some kind of MINIMUM standards of immunity to radio frequency energy. What happpened was the pro-business Reagan FCC easily buckled under pressure from the manufacturers of these products, who didn't want any government regulation to deal with. What they proposed, and the FCC accepted, was a so-called "voluntary" system, where they promised to solve each problem (like yours) on an individual basis. So what you need to do is to contact these same manufacturers, and get them to solve your problems, as they promised the FCC that they would.

I am assuming that your ham neighbor is running his station legally, and he is not transmitting any measurable radio energy outside of the frequencies that he is licensed by the government to operate on. What you might ask the manufacturer of your phone, for instance, is why a telephone is picking up any radio signals at all? You might also ask the manufacturer of your TV why, if for instance you have the TV tuned to 500 MHz watching a TV station broadcasting at 100,000 watts, why a ham transmitter in your neighborhood transmitting with maybe 100 watts on 14 MHz is bothering your TV?

The manufacturer of your TV should be able to fix you up with a high pass filter that will reject all radio energy below 50 MHz. If it still picks up your neighbors transmitter, the manufacturer might be asked (if this is the case) why they designed a device (a TV) which essentially uses radio energy, but ignored one of the basic design criteria for radio frequency devices....that is to shield it by putting it in a metal case, rather than plastic?

Anyway, good luck. The American Radio Relay League, 225 Main St,
Newington, CT 06111 has some good material on reducing interference.

> like to be able to access with the 731, but I can't.

This may be because the VCO needs to be retuned to work this part of
the band. The radio may not even be listening up there, even though
the dial reads ok.

\begin{soapbox}

NOTICE What you want to do with this radio is NOT LEGAL, and for
good reason. The business band use requires a type accepted radio,
which must meet tighter specs for frequency tolerance and spurious
emissions, among other things. If you must use the radio for both ham
and non-ham purposes, buy a commercial radio. There is no problem
with using them on the ham bands, and the extra price will assure a
non-interfering unit. Interference with public safety communications
is a really bad idea.

Rare *emergency* use is another matter...

\end{soapbox}

Source record: 13378

First of all, DO NOT rely on the news release for facts to base your comments on. DO NOT rely on what is posted here, either. Go to your nearest library that has federal documents and read the actual PROPOSAL itself (which will have the real details). Then you can make your comments based on the facts.

What you must do for filing comments on a rulemaking proceeding (and this is what this is) you need to read FCC rules Part 1. Ask the librarian for the "Code of Federal Regulations", look for the 5 books marked "Title 47", select the 1st and 5th books (Part 1 is in book 1, and Part 97 is in book 5). Read the index to Part 1 and find the section on rulemaking proceeding. There will be references in those rules about the form and copies necessary for both informal and formal comments.

I don't have all the details in front of me right now, so I cannot make a posting yet on what to do. There will be time for that. But you could if you want to, research it on your own, and actually LEARN how the bureaucracy of the Federal Government is working.

There are times when knowing CPR can be very useful and even save lives.
There are times when knowing a foreign language can be very useful ....
There are times when knowing how your car works can be very useful ....
There are times when firearm safety can be very useful and even save ...
There are times when a bizillion other things can be very useful ....

We are all required to know International Morse code because it was recognized
as incredibly important to merchant ship safety in the early part of this
century. (Anyone who doesn't think the FCC believes this try to get a
commercial license. Yes, I have one.) If code is so extremely important
and ultra reliable, why is the requirement that all vessels exceeding
500 Tons have a CW station being phased out in favor of the EPIB devices?
(EPIB=Emergency Position Indicator Beacon)

No one is going to restrict the ships from using code if they want to do so.
Probably all of the vessels which regularly use code now will continue to
use code after the requirement is gone. For what code does, it seems to
work well. The maritime service, however, is leaving the hams in
the dust. We seem to have come full circle now. The hams were once the
cutting edge of electronics. We are now the last holdouts of a dead era.

As a matter of record for everyone who wants to know how much code I
work: I don't recognize my own call sign in code. I have never connected
a key to my rig.

Well, geez everyone else is writing something on this subject, and since the "snowball" has already become an avalanche... why not me?

Some people like code.... but that shouldn't have anything to do with forcing it on someone else, right? Makes sense.

Some people don't like code, but had it forced on them and they're pissed off about it. Seems to make sense too.

A requirement to learn morse has not kept out the undesirable elements as can be proven by listening to either 2 meters, or 75 phone (depending where you live in this country). That's a given too!

And I could go on and on and on. So it is very LOGICAL to completely do away with ALL morse (international) code requirements, and we all should welcome a "Communicator Class" correct? Then why do I feel nervous about it?

I guess it has something to do with human nature. I honestly believe that people value most what they had to work for the hardest. What they are "given" they tend not to respect. What they worked hard for they tend not to "give" away. The majority of hams had to "work" to learn CW and as such they usually tend to "value" the license. I think there is an unspoken fear that those that come into the hobby without having to "work" for it will not value it, and others might suffer the consequences of such an attitude.

I am not espousing CW as a necessary form of "hazing", (as I am sure someone might think from reading this) however it occurs to me that any written test can be memorized and the material quickly forgotten (if it ever was "learned") after the test is taken. I defend this statement by the evidence of how many hams today can repair their own equipment. I know I invite flames here, but I am very sorry to report that in this area there are very few people that can use a meter correctly let alone an oscilloscope. Maybe there are many good reasons for this, but the fact is.... they are not technicians in any way, shape, or form.... nor do they want to be.

I hear it said (by very many of late) that they resent being required to learn something that there is no logical reason to bother with, something that they'll never use, something that is inefficient and is a total waste of time... for them. I am of course again talking about Morse Code.

Well, OK!!! But hey.. let's do away with the theory requirement too. Why not? You say that it is required because we are allowed to work on our own radios right? Well folks, guess what? A CB'er is allowed

to work on his own equipment too! NO!!! I can feel the heat already! I stand ready to be corrected, but recent questions to the FCC in this regard have led me to believe that ANYONE can work on ANY radio, with the exception of certain emergency service type radios to include Marine VHF and Aeronautical NAV/COMS (airplane radios). The station licensee is still held responsible for the emission and spectral purity requirements, but he is NOT required to have anyone special "do the work". This sounds amazingly similar to ham radio to me, and minus the vastly greater modes and power, there doesn't seem to be much difference in the requirements of who can work on the gear.

So why should ANYONE be required to take a theory test? Hey, a lot of people don't WANT to build anything, nor do they want to REPAIR anything. Why should they be required to LEARN something that they have no use for and is a complete waste of their time! Sure they could memorize it and then forget it, but hey... IT'S THE PRINCIPLE OF THE THING, AND THEY RESENT IT! If the radio breaks.. then it goes back to the factory. If they want to get on packet, well.. they'll buy a TNC and plug in the cable. What's the big deal? If a person is a technical wizard, then there is no need to test him on his skill, and if he wants to contribute to the hobby and has the skill, then the test won't serve to motivate him any further!

There are a LOT of people that would make TERRIFIC hams, but they just can't seem to pass that darn written test. They are GREAT at the Morse code thing.. they can zip out 35 words per... but they just can't seem to get the hang of that old OHMS LAW thing. Why should we restrict these people from the public frequencies of HAM RADIO? After all they are just going to BUY a radio anyway, and odds are that they can figure out how to turn the "off" switch to the "on" position!

Yes, I am being sarcastic. But it is amazing how similar the arguments for a "no theory" license could be to the current "no code" debate and make just as much sense.

Believe it or not, I accept a no code license as inevitable and it may even turn out to be the best thing since sliced bread. I sure hope it does. However... CB radio used to be a disciplined and fun band where teen-agers experimented with antennas and even played around with morse code. They exchanged QSL cards and never spoke a word of profanity. Of course this was WAY WAY back when, right after amateur radio lost 11 meters as a ham band. For some reason these people valued the privilege of being able to talk on a radio, beats me as to why. My only concern is that someday the average ham will lose the same views as those old time CB'ers had "way back when".

Everything changes I guess.

A friend of mine has succeeded in doing this.

As soon as he has written it up, I will post the
modification.

It opens up the cellular band as well as 66-88Mhz.

It only requires addition of a small spdt switch.

Film at eleven...

one more line to make this stupid news posting program
happy and to waste bandwidth...

Yes, the NORAD elesets for high altitude objects are rather noisy. This has been a problem for the AMSAT phase III satellites (Oscars 10 and 13); G3RUH occasionally produces "smoothed" sets that give excellent predicts for very long intervals. Another problem for geostationary satellite orbits is that the longitude-dependent assymetries in the earth's gravitational field become very important. I don't think any of the orbit models currently used the popular ham satellite tracking programs take these into account. (They usually consider only the much larger latitude-dependent assymetries.) NORAD has released a set of FORTRAN programs designed to be used with their element sets, and the one for high altitude satellites is quite hairy.

Not that the geostationary satellites themselves are perfectly stationary, of course. Some time ago, when I returned to WMPB-TV for a visit, they were uplinking Wall Street Week to a Westar satellite. For the heck of it I took a look at their downlink signal on a vectorscope that was synchronized to house (uplink) subcarrier. (For those who are not into video engineering, a vectorscope is a test instrument that displays the color subcarrier in a video signal in polar coordinates on a CRT. Color saturation at any given instant is represented by the amplitude of the vector, and hue by its phase.)

Anyway, the pattern on the vectorscope was rotating very slowly, caused by the relative motion of the satellite with respect to the earth (and the earth station). Since the color subcarrier has a wavelength of approximately 80 meters, one complete rotation of the color subcarrier on the scope corresponds to a change in relative distance of half that amount, or 40 meters (because the signal covers the distance twice in a round trip). Subcarrier phase changes corresponding to a foot or so of distance are easily seen and measured.

Not bad precision out of a slant range of about 40,000 km. If I could get a whole day's figures (instead of just one half hour) I could determine the orbit of the satellite quite precisely. It would be very interesting to watch the display when the satellite control station commands a station keeping maneuver.

Suppose someone told you back in the Glory Days of computing that you wouldn't be allowed to use a given system until you had memorized, in HEX, the bootstrap code, and were required to be able to toggle it all in within a certain time limit? You'd be pretty pissed, since all you wanted to do was run your Fortran monstrosity on the already-running system. If you *did* have to boot the machine you could always read the hex off a piece of paper, or better yet, fix the machine to have it in ROM.

The educational system in general is rife with people who insist that the student rote-memorize a lot of things he will never again have use for. This doesn't mean the teacher is good; it means that the student falls asleep and forgets it all right after the exam. Unless, of course, he is interested in the subject material.

So step into the 90s, guys! Let people who really *want* to learn code do so freely, but leave the rest of us alone.

I don't know if there is any advantage unless you are likely to become involved in a lot of public service (eg. marathons, disaster relief, etc.) where quick and positive identification of your vehicle could be helpful. Here in Texas, they only charge two or three dollars to process the application. The cost of the plates themselves is the same as the standard non-personalized ones.

For telephone use, any capacitor should be rated at minimum 250V. For larger values, the capacitor should be Mylar. Smaller values can use Ceramic caps, but use the highest voltage rating you can find, but still no lower than 250V.

The ring voltage is not the only high voltage on the phone line. The inductive pulse generated by taking a phone off-hook, or rotary dialing (What dat?) can be above 300V. If you don't believe me, place your fingers across the line and flash the hookswitch a couple of times.

Besides the "official" voltages found across a phone line, there are also accidents and acts of God. Power lines can fall across phone lines. Lightning can send some impressive voltages down a phone line. If you want to see what a phone should withstand on its terminals, read FCC Part 68 or Bell Pub 48005.

The above should also be borne in mind when using semiconductors. Diodes used in bridges etc should be rated at 1KV Min.

And yes, you can use MOVs on phone lines. Much phone equipment uses them. The 120 - 150V ones are OK, but the use power when the phone rings and 250V ones are often used to get around the problem.

Yours

Re: Ham license plates

Cheap vanity plates certainly are my reason.

BTW, my in-queue reading at the BMV last licensing session was the Ohio book of license plate identifications. The ham plate example was a K6.

The west coast influence is getting out of hand.

73,

The frequency range 70-88 MHz (approx.) is also used for public safety organizations in Germany and some other European countries. In Germany it is called the '4 m - band'; most police, fire departments, civil defense, ambulance services, etc. have their nets here, mainly repeater systems with repeater inputs below 80 MHz ('low band') and outputs 9.6 MHz higher ('high band'). Transceivers (FuG 7b, FuG 8b) are full-duplex, synthesized, 8 W output. Channel designations begin with 4 or 5 (e.g. 409, 506) and have 20 kHz spacing. Modulation is NBFM.

Hope this helps!

It sounds like there is RF in the shack. I have had similar problems and there are two types of solutions: keep the RF out of the shack, or reduce the suceptability of the equipment. I have not had much luck with either approach. I tried a MFJ Artificial Ground. It did reduce the level of RF in the shack, but seemed quite sensitive to anything changing. I later sold it to a friend who had a worse problem, and it fixed his problem. My was the keyer picking up the RF and locking key down. I shielded the keyer and its cable. Put all sorts of bypassing and filters on the cable and that helped also. However, neither of these approaches alone completely solved the problem. I never had the opportunity to try it with both in place...

With the current discussion of Amateur Radio Service Licence plates, i was wondering if anyone else has run into the same problem as I recently encountered here in South Carolina.

Amateur Radio Service plates are one year, renewable, and cost only $1 more than normal plates (as opposed to $13 EXTRA for personalized ones). I have a lease car, and for the past three years, have had no problem getting my plate.

This year, the day that my then-current tag was expiring, I found out that I was being DENIED the special plate because my name did not appear on the registration in the same form as it does on the license (due to the lease, the registration is in the name of the leasing company IN CARE OF my name). According to their new interpretation of the laws regarding issuing ARS license plates, I was no longer eligible.
